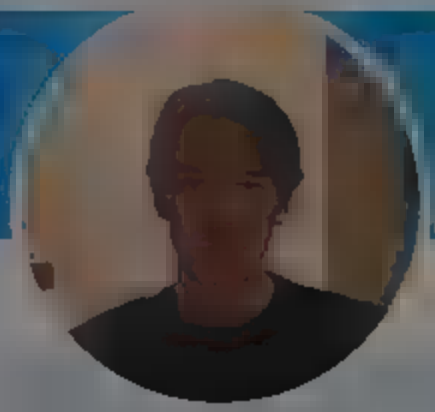
This is great. The first time the notion of "asymptomatic transmission" was mentioned, I smelled a rat. It's biologically implausible. Not saying it's never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

ARTICLE

https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]



Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apnl 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

Good question but literally impossible to guess. It's invalid to adopt someone else's rate.
I note they were running around twice as many tests per day as we are now.
What we don't know if whether they were using a dusty old building filled with freezers (it was UK Biobank).

Todd Knapp @boomkamusic · 20. Aug.
Is that a flock of ducks I hear?

1

Todd Knapp @boomkamusic · 20. Aug.
Of course a T-cell response can be called "immunity" but doesn't necessarily prevent infection 100%. You're equivocating.

1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @boomkamusic @richardursomd

No, that's incorrect. We know that T-memory responses are HIGHLY specific or you'd consume your own body through autoimmunity. So when you see distinct T-cell responses to the relevant antigen, you are functionally protected.
What else do you think such specific responses mean?

Recent paper which the authors misinterpret: assets.publishing.service.gov.uk/government/upl ...

Look at how they've defined 'high levels of T-cell responses'.

CoV-2 are protected from COVID-19.

Note: This work is a pre-print, which means it has not yet been peer-reviewed

some T cells specialise in fighting viral infections.

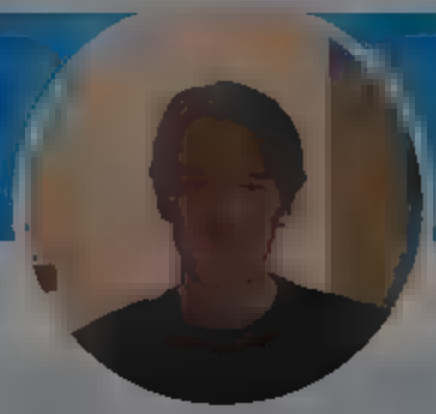
About 1/4 of the keyworker population studied had high levels of T cells which recognised SARS-CoV-2 in their blood when they joined the study in June 2020. By 'high levels' we mean levels similar to those seen in people who have had COVID-19 disease. However, about half the people with high levels of T cells in their blood have not had COVID-19, as far as we could tell- the cells were probably there because of previous infection with coronaviruses other than SARS-CoV-2.

3

EDSAB-HOME study: details, research protocol and outputs

Importantly, in our study people with higher levels of circulating T cells appeared to be protected from COVID-19 in the four months after recruitment in June 2020. This applies both to people who have been previously infected with COVID-19, and to those who had not.

Personal belief in past COVID-19 illness is not necessarily reliable



Laboratory based antibody tests (Roche Elecsys anti-Nucleoprotein EUROIMMUN anti-Spike S1) detected >95% of key workers who had had previous COVID-19 tests.

Note: This work is a pre-print, which means it has

About one-third of keyworkers believed they had

in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hu
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10,9], Fujian Song[2,3,4], Xiaoxv Yin[1,9] & Zuxun Lu[1,9]

Stringent COVID-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

Marty is right. There was a pandemic & it swept the globe.
It killed many. Then it stopped doing so. As you'd expect. The population acquired herd immunity months ago.
"Why is the pandemic not over? Because SAGE says it's not".

Prof. Devi Sridhar @devisridhar · 2 Std.

The real question about Christmas-> do you want to expose the people you love to this virus? Do you want to be responsible for the virus spreading at your home, or as a guest in someone else's? If you don't, be cautious. Don't need govt to tell you that. It's common sense.

I don't recall Cathy Newman telling you of Prof Shridhar's connections.

Or that her academic quals are limited to a 2y biology degree. We used to call that "an A-level".

Not intentionally mean. But I've a 4y degree & 3y PhD + 32y practising research in my fields of training.

Steve, way past “risk the cure is worse than the disease”.

Hard to be certain of #s as death stats distorted by PCR-error misdiagnoses.

We think 100 of our fellow citizens EVERY DAY are dying avoidable, non-covid19 deaths due to restricted access to NHS.

How do you sleep?

Is anyone able to help connect me and Keir Starmer?

I will make myself available to him by phone or Zoom at any reasonable hour, including today.

I will provide verifiable facts so not asking him to be “taking a chance”.

SAGE never provides verifiable advice. Why don’t they??

With respect, he's no idea whether or not the PCR test as conducted now is reliable. How can he know whether or not it is? Not by looking at tech specs. That's not where errors arise. For that, it's necessary to know the operational false positive rate. Govt doesn't know it.

I thought about this. If Labour is whipped to vote for continuing restrictions, the # of 'rebels' on the Tory side required to defeat a Govt motion is beyond precedent.

Asked a Tory MP about the maths. The reply was "it's completely impossible, if Lab votes for restrictions".

He wouldn't be taking a risk.

It's already certain that around 700 innocent people per week are dying from non-covid19 causes, secondary to 8mo & counting of restricted access to the NHS. Average

Does anyone think you wouldn't expect excess deaths from this cause?

...something terrible happened to the integrity of the PCR mass testing system. The level of cross contamination confirmed by Dr Julian Harris (& many of things) renders the results untrustworthy.
Liverpool LFT results confirm our statements. Many MPs confirmed they agree with us

11 74 376

Space Admiral Nathan of Bankrupt Satellites Ltd @nathansldennis · 14 t

LFT is a less sensitive test, all it confirms is that a less sensitive test only finds people riddled with Covid whilst a more sensitive test finds more.

Just think Michael, with your halfwitted theories we could end all drug use in sport just by using less sensitive tests!

8 2

Yardley Yeadon
@MichaelYeadon3

Seuraa

Vastauksena käyttäjille @nathansldennis, @SpeedyShev ja @devisridhar

It has completely adequate sensitivity to correctly call positive every person with sufficient virus to be positive in a viral culture.

PCR calls positive samples which are not infected or infectious. That's on a good day.

Don't comment beyond your expertise. You look foolish.

Antwort an @spion @SpeedyShev @devisridhar

I'm not saying now there are no excess deaths. In the past, there were not, despite 1000s of 'Covid19 deaths'.
What you don't see is the clinical picture leading to death. Most recent excess deaths aren't Covid19 (some are). They're dying from NHS restrictions. As you'd expect.

...something terrible happened to the integrity of the PCR mass testing system. The level of cross contamination confirmed by Dr Julian Harris (& many of things) renders the results untrustworthy.
Liverpool LFT results confirm our statements. Many MPs confirmed they agree with us

Ok, I'll bite.
Select one major part of my thesis that I say SAGE got wrong.
Eg prior immunity.
I'll wait.

By the way, it's the other way around. I've reached out in private to several SAGE members. They know who I am & how to reach me. Not one has replied.

I'm a fan of what they're doing in Liverpool because they're assisting in testing volunteers using a new test, the lateral flow test. Unlike PCR, it doesn't suffer from over amplification or cross contamination. So far, their results confirm what I'm saying. Almost no virus found

I don't like that the army was used to mass test secondary school pupils without a plan, ethics, consent. Breaches Good Clinical Practice (GCP) & the law.
BUT lucky break: results utterly contradict Govt narrative of a pandemic (PCR) when we're seeing at most low, endemic levels.

Can you explain something I'm genuinely confused about. You have spoken a lot about false positives, how come Australia was doing about 20 000 PCR tests a day with no positives whatsoever?

1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @NROK1227

No idea, can I ask you something?
Why do you appear to believe there's automatically any relationship between Australia's test system & U.K.'s (doing over 370,000 per day)?
The vast majority of errors are not intrinsic to the PCR test itself, but arise in sample processing.

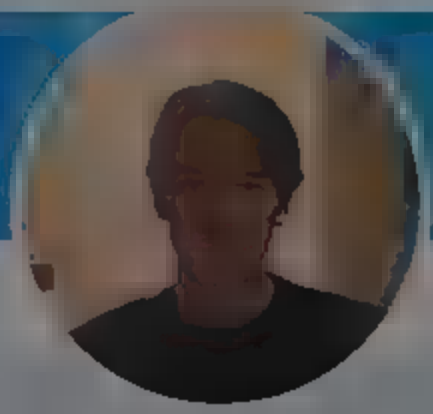
That's exactly right. Imagine PCR didn't exist. Medics treat acute respiratory illness as usual. Assign cause of death according to clinical judgement.



Now the stats show nothing unusual on respiratory side, but a growing wave of home deaths, as if access to NHS was restricted.

Yardley Yeadon @MichaelYeadon3 · 2 Std.
Steve, way past "risk the cure is worse than the disease".

Hard to be certain of #s as death stats distorted by PCR-error misdiagnoses.

We think 100 of our fellow citizens EVERY DAY are dying avoidable, non-covid19 deaths due to restricted access to NHS.

How do you sleep?

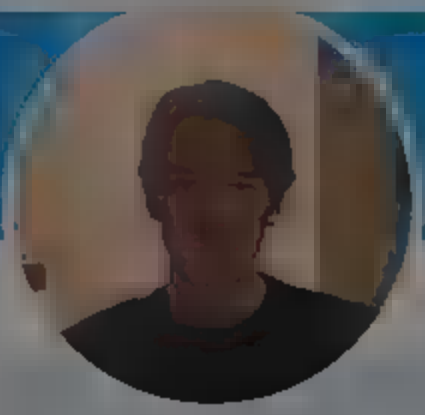
29 136 648

@COVIDbattler @covidbattler · 11 Min.
I think you can be fairy certain about the in-hospital deaths - the PCR adds to the existing history, examination, laboratory and radiographic findings of COVID. I agree the community ones are less certain - hence why excess mortality is probably better.

1

Yardley Yeadon
@MichaelYeadon3

Folgen



Antwort an @covidbattler @SteveBakerHW

I agree, & assure you, I'm not the one doing the careful analysis.
Reason: not my skill area.
We've lots of highly skilled experts looking at all the data on deaths right down to geographic location.
Just in the last week or so, some is Covid19.
At endemic levels.
Rest isn't.

Roughly, but need to subtract 0.32% operating false positives PLUS a bit more, because the 0.32% comes from external validation by (I think) DSTL Porton, anyway, skilled 3rd parties.
In real world, FPR will be a bit higher. Note that positivity fell in each of the 1st few days?

By day 3, IIRC, positivity was so close to reference that it approx. zero.
My own guess is it's endemic at very low levels.
And this is in the most infected city in the national "hot spot".
Doesn't this tell us that it's over?
Remember that, apart from PCR, there's no signal.

Anyone thinking the phrase 'pandemic is over' is extreme, a definition: 'uncontrollable spread of disease...'. Further to this, an epidemic, defined as 'local spread of disease...' is also not a term that can be applied to the current position. We're not in a state of emergency.

Mystified at amazement that 3 vaccines have "worked". I don't find it surprising.
This is because much research shows that a substantial % of the population had prior immunity. All infected are immune after exposure, proven to protect.

Humans easily become immune to this virus.

79 314 951

Guy Gadboit @gadboit · 8 Min.

In Pfizer trial 162 people in the placebo group got Covid and only 8 in the vaccine group. It does work! But not as well as herd immunity. If population had been 100% susceptible there would have been 10k in placebo arm and -500 in vaccine arm unless it reduces infectiousness.

1

Yardley Yeadon
@MichaelYeadon3

Antwort an @gadboit

Can I just check? Did the vaccine stop people "getting Covid19". Covid19: disease caused by SARS-COV-2.
Disease means ill.
I thought endpoint was PCR. Not even infected.
To claim vaccine "works" is a stretch.
They've shown it prevents you becoming PCR positive. That's all.

Vastauksena käyttäjille @MichaelYeadon3 ja @FormerType2

Is there any possibility that these vaccines were originally developed for a previously circulating virus (such as SARS-COV-1) and so we have 15 years or so of safety data? I assume that immunity to a particular virus may give immunity to a similar virus.

Ali #KBF @2020Smiles · 4 min

Vastauksena käyttäjille @MichaelYeadon3 ja @FormerType2

Yet they're buying a very expensive new AI system to track the high number of adverse reactions expected.
So huge risk for the public for zero benefit, and total indemnification against risk for Big Pharma, govt, NHS.

Dr. Data @All_thingsdata · 32 Min.
Hang on...assuming there are an equal amount of people with immunity in both the placebo and vaccine groups (reasonable), then level of underlying immunity doesn't factor into the efficacy calculation...

4

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @All_thingsdata

That's not my point.

My point is around 70% are already immune (prior immunity plus recently acquired immunity).

The reason for this is how readily humans become immune to this virus, immunity which offers robust & durable protection.

Why? We have t cell immunity due to other coronaviruses and covid. Vaccine tries to replicate that (but doesn't do it as well). So most people don't need it. And since it is a new technology there are only a few months of evidence to say works so is highly experimental.

Jansen Mann @jansenmann · 21. Nov.
I wasn't talking about the Dr that's shilling for the lockdown sceptics, it was aimed at Martin.

Not so ridiculous.

If you're going to be insulting, it merely demonstrates the paucity of your argument.
You haven't got anything to say about my interview?
I'm retired. I'm not interested in politics. I'm more than interested in science.
Why would I say what I do unless I believe it to be true?

Astonishing claim. The two authors live or die by their neutrality when examining evidence. I note Prof Jefferson wouldn't be drawn on the political implications, despite stating that the study provided no evidence of benefit to the wearer. Rightly so: that's a political issue.

Landmark Danish study shows face masks have no significant effect | The Spectator

1,8 Tsd. 5,1 Tsd. 12 Tsd.

Simon Preston @simonpreston · 20. Nov.
You can show pretty much anything has "no significant effect", in the statistical sense, with an underpowered study. The claim will *obviously* be misinterpreted in the lay sense by most. Hence absolutely right for this to be flagged by Facebook

Why do you assert that the study was underpowered?
Separately, the study wasn't conducted by the authors of analysis, and it was the latter which was deemed misleading. All they did was tell us what was found: no significant effect. Genuinely confused by your take.

Further, the reviewers mentioned an additional analysis by the authors. They'd divided the masked group into those who said they'd followed the protocol closely & those who didn't. The idea was the effect size would be greater in the former group, if masks worked.
It wasn't.

It isn't expert opinion though.
How exactly is someone with a PhD in respiratory pharmacology an expert in infectious diseases, diagnostic testing, public health and pandemic response? Ultimately, he is well outside his area of training & expertise.

I think I can help you. The heart of this is immunology & I'm highly qualified there. There were no immunologists in SAGE in spring. The one on it now has forgotten his teachers lessons. We know this because Ivan Roitt was also my 'teacher'. He wrote the course text.

From 1:35.45s, you'll see lawyer Reiner Fuellmich (who's sued badly behaved corporations such as VW) who today filed a class action lawsuit based on unreliability of the PCR test.
Last week, the Portuguese court ruled it was unsuitable to restrain people.

...skills to be running these technically very difficult tests. Now we've "Lighthouse Labs" running over >350K tests per day. Are they hunting down "2nd waves" (which don't happen) or inadvertently creating them?
Before we question testing, let's see the literature. Now, please.

Reiner Fuellmich starts German lawsuit against the SARS-CoV-2 PCR test.

Portugal last week determined it unsuitable to determine infection, infectiousness or to restrain people's normal movements.

I hold the same concerns about U.K.'s PCR mass testing.

The reason that these people have died at home in huge numbers is NOT because the NHS is overwhelmed with patients who've tested PCR positive for SARS-CoV-2.
The bed loadings are below normal in all departments with exception of some ICUs, some cities.
What's the real reason?

Still like ONS as an organisation (I think). But as I understand it, they don't do their own PCR any longer.
Previously there was something astonishingly good about ONS's SARS-CoV-2 data. It was as if they knew what they were doing. I wondered then if they retested positives.

You've also chosen to follow unprecedented industrial molecular biology & ignore decades of immunology.
May I ask why?
If you believe it's a 2nd wave, you either believe it's a new phenomenon or there is literature.
If it's the former, how did SAGE know it would happen?

Antwort an @Rolo_Tamasi @bootyerhawmaws und 4 weitere

PCR itself is indeed very good. But serious issues arise before the reactions.

Do you know what these are, how they arise & how to detect them? Do you know how to reduce them?

If they occur, they destroy the integrity of the entire testing system.

Humans easily become immune to this virus.

274 1,4 Tsd. 4,7 Tsd.

Dr. Data @All_thingsdata · 12 Std.
Hang on...assuming there are an equal amount of people with immunity in both the placebo and vaccine groups (reasonable), then level of underlying immunity doesn't factor into the efficacy calculation...

5 11

Yardley Yeadon @MichaelYeadon3 · 11 Std.
That's not my point.

My point is around 70% are already immune (prior immunity plus recently acquired immunity).

The reason for this is how readily humans become immune to this virus, immunity which offers robust & durable protection.

14 22 111

RetroNic Smythe @RetronicSmythe · 1 Min.
I still don't understand how the test subjects are given exposure to the virus. Just "not catching it" surely isn't enough - you would need to isolate the virus in a lab and literally inject it into the test subjects. Do you know how they are creating the test exposure?

except ONS, who I love. Proper, independent professional.
Mass testing has gone full rogue. Max Ct, no retests & no idea what the FPR is

13:50 · 04 Nov 20 · Twitter for iPhone

2

Yardley Yeadon @MichaelYeadon3 · 2 Std.
Still like ONS as an organisation (I think). But as I understand it, they don't do their own PCR any longer.
Previously there was something astonishingly good about ONS's SARS-CoV-2 data. It was as if they knew what they were doing. I wondered then if they retested positives.

1 3

Henry Nash @gasdoc1982 · 2 Std.
I think they are honest people trying to gather and display the information as honestly as possible.

I suggest they may still have good data, and their results may be real... (Subject to estimates for extrapolation to the population etc)

information they've used to create their model relating to the so-called "2nd wave". I ask because I can't find any foundational literature on this field. Just post-WW1 stories. There is surely much...

29 334 919

Tree @Tree17891 · 2 Std.

Yes. I pestered many blue check experts over summer on their predictions of a massive 2nd wave. The few who responded just cited 1918 with no explanation....

Experts have been obsessed with 1918 since this thing started, even though this is obviously nothing like 1918....

4 31

David dinon @d_dinon · 2 Std.

thank you!!! ive been sayin this since day 1 bc they started mentioning the spanish flu n comparing it with covid n how it swept thru with 2 waves so automatically covid HAD to have a second wave although it makes no sense.. n bum.. here s the second wave automatically in autumn

1 5

Going5DBaby @DGoing5 · 45 Min.

Yes I said that too. I heard the Spanish flu was an H1N1 but even this virus doesn't do a "second" wave. I wonder if there really was a "second wave" in 1918 or if it just spread to different places earlier then later like you saw even with the Hong Kong flu in 68.

Can anyone tell me how many of the 131 volunteers were symptomatic & became seriously ill? I note the article stated that “no one on the vaccine became seriously ill”. That statement is only meaningful is many non-vaccinated people did become seriously ill. I note 1 death.

More than 24,000 volunteers were involved in Oxford's phase three trials in the UK and Brazil, half of which were given the vaccine and the rest were given a fake jab. There were only 30 cases of Covid-19 in people given the vaccine compared to 101 in the placebo group. None of the participants who took the vaccine fell seriously ill

Don't need the PM.
It's been routine all year since they got daily capacity to do it, many, months ago.
They also test long stay patients regularly.
Long stay = sicker & more likely to die.
Tested more times = more likely to test positive.
Covid19 deaths rise.
Little known.

For in coming close, we know what happened numerous times in the past when seafarers misunderstood the cues, misread the warnings. The first time you would learn you'd gone horribly wrong, was also beyond the last time for a safe outcome. Warnings from history? I don't know.

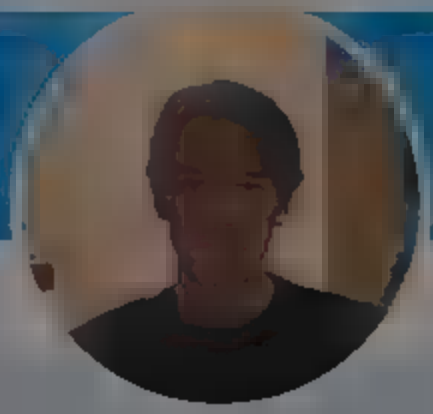
...an area I was working on (asthma) & realising this was one of the oldest continuously published medical science journals.
How low has NEJM sunk that, earlier this autumn, it published one of the most frightening things I'd read (it's been beaten but I genuinely felt unwell).

support trying less burdensome policies before moving to more burdensome ones whenever possible. In this case, the costs of a failed voluntary scheme are sufficiently high that the attempt should be limited to a matter of weeks. States should implement a system for measuring vaccine uptake within each high-priority group against a set of coverage targets. Ensuring that the economic and logistic supports described above are in place will maximize the chances for success.



If the proposed trigger criteria were met, what might a vaccination mandate look like? Because the constitutional power to protect public health rests primarily with states, each state will need to adopt its own legislation. Proposed legislation should be supported by attestations from the state health officer, the ACIP, or another expert committee that all trigger criteria have been met. Targeted SARS-CoV-2 vaccination mandate policies may also be appropriate in certain federal contexts, including high-risk groups in active-duty military environments, Veterans Affairs facilities, federal prisons, and immigration detention centers.

Although state vaccination mandates are usually tied to school and day care entry, that approach is not appropriate for SARS-CoV-2 because children won't be a high-priority group. In addition, state mandates should not be structured as compulsory vaccination (absolute requirements); instead, noncompliance should incur a penalty. Nevertheless, because of the infectiousness and dangerousness of the virus, relatively substantive penalties could be justified, including employment suspension or stay-at-home orders for persons in designated high-priority groups who refuse vaccination. Neither fines nor criminal penalties should be used, however; fines disadvantage the poor, and criminal penalties invite legal challenges on procedural due-process grounds. Both are bad public health policy for a Covid-19 vaccine because they may stoke distrust without improving uptake.

Antwort an @naholant @JamesMelville

Please, consider the thousand people dying at home in a single week (in the figure James posted). They're not, or mostly not covid19, but heart failure, stroke, diabetes etc as Jon tells you have soared. The horrible reality is they're dying because of 8mo restricted NHS access.

You can call me Al @At_Home_Al · 19 Std.

A thought: the other diseases and accidents that people would be exposed to in normal circumstances must have been significantly reduced by lockdown as well. Is it appropriate to draw any comparison therefore? BTW I'm not a fan of how this has been handled, but wary of stats.

Antwort an @At_Home_Al @JamesMelville

They haven't been reduced. It's that many such deaths due to those causes have been misclassified as covid19 due to an unreliable test result. And a cause of death rule that forces misclassification. While there are some genuine covid19 deaths, we believe the majority aren't.

Antwort an @chrismardell @At_Home_Al @JamesMelville

I've learned that unless flu is actively tested for, the symtomatology is sufficiently similar that many such deaths will be classified as covid19. Flu can't really have gone, can it?

How can this be correct? The obvious answer is if many non-covid19 respiratory deaths are classified as having been caused by covid19.
One example would be COPD. Future deaths are 'baked in' decades ago from long smoking history. If they reduce, it can ONLY be misclassification.

What this tells us is that around 1000 deaths/wk are not to do with claimed resurgence of virus, as also occurring in summer when no excess mortality. For same reason they're not to do with virus infection now. Please take into account when looking at excess deaths.

Judgey @MartinJudge10 · 16 Std.
The actual data is more confusing than these graphs suggest

Flu and Pneumonia involved deaths are more than covid involved deaths.

Covid deaths are only more when the underlying cause of death is compared.

Should a dubious PCR test decide the underlying cause of a death?

1 1

Yardley Yeadon

No. What's worse is we know a positive associated with high cycle threshold (>35, some say >30) isn't really a positive. Neither infected nor infectious
But astonishingly the SOP runs to 40 cycles.
Worst of all: you can't find out ANYTHING about positivity & Ct: a state secret.

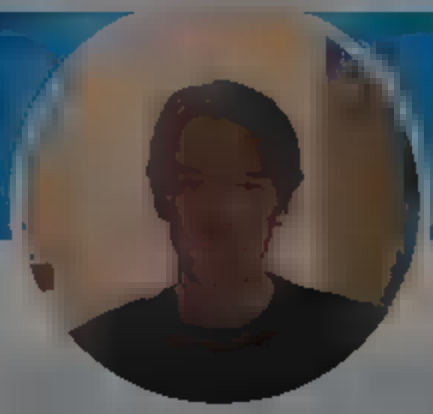
Do you know how many of those “cases” are markedly symptomatic?
Do we know how many of them are in people over 60 and/or already very ill?
The others will recover & be immune with no intervention.



Then there’s the problem that many positives aren’t correct & are false.

virus case numbers and deaths not double every 3-4 days throughout June, July and August, and indeed throughout the Autumn?

8. Why have positive test results rocketed while numbers of symptomatic patients in the community and NHS triage data show they have flatlined since mid-September?
9. Why are acute respiratory admissions through Accident & Emergency significantly below the normal for the time of year if the pandemic is still raging?
10. Why are total hospital admissions, ITU occupancy and hospital oxygen consumption at or below normal levels for the time of year?
11. What percentage of deaths labelled as being due to COVID-19 have had the diagnosis confirmed at post-mortem since July?
12. Why are the regions of the country that have had excess deaths not the same regions that have supposed COVID-19 deaths, unlike in spring?
13. Why has Liverpool testing by the Army failed to find COVID-19 in the community when they are supposedly at the centre of the alleged "second wave"?
14. How is a 0.22% rate of diagnosed infection in the public in Liverpool to be reconciled with the ONS prediction of 2.3% infection rates in Liverpool on 11th November based on PCR testing?
15. Why are much quicker lateral flow tests not being prioritised for hospital admissions to prevent the standard 24–48 hour delay with PCR results and ensure that those who are positive can be isolated to prevent hospital spread?
16. Why aren't all staff being tested by the lateral flow test to prevent the staffing crisis being caused by false-positive PCR results?
17. Do positive PCR tests for asymptomatic and symptomatic NHS staff, or anyone else, which result in them being required to self-isolate have confirmatory re-tests performed?

Coronavirus (COVID-19) Infection Survey

4 1

Yardley Yeadon @MichaelYeadon3 · 23. Nov.
Henry, this is precisely my concern. There is no "Prior art", as my medicinal chemistry friends might say, "teaching me towards" 2nd waves. So what is that which you're showing me?

3 1 9

Henry Nash @gasdoc1982 · 24. Nov.
It's a surge in positives from this study (also seen, to varying extents in REACT and ZOE):
ons.gov.uk/peoplepopulati...

I'm not fussed about terminology re waves, but this fits with ICNARC data of a further surge in cases.

2

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @gasdoc1982

I do think there's some resurgence. I don't think I've said ANY cases are impossible. Even with mass vaccination you'll still get some disease. Natural or vaccination 'herd immunity' stops large outbreaks but not all cases.
But SAGE predicted a huge 2nd wave, 2x spring '20. Why?

less than scrupulous conditions under which they are carried out. (C4 Dispatches)

1 5

Henry Nash @gasdoc1982 · 24. Nov.

That's why the graph is of the proportion that is positive and the pillar 4 testing is done separately.

REACT didn't even have a significant increase in subjects, but still showed this surge

1 1

Greg @WWakeUpTime · 24. Nov.

Yet respiratory admissions and deaths have been inline with 5 year averege consistantly since June, most weeks below it. Remove PCR. Where is the clinical evidence? If we were in a second wave the data would be screaming in our face like the first wave.

2 2

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @WWakeUpTime @gasdoc1982 @lcbrown62

Greg, quite. If we set aside the PCR test results & only look at clinical picture & death stats, we see that nothing particularly remarkable is happening.
I'm asking "Why did SAGE predict a large 2nd wave?"
No one has offered the slightest explanation.
That's worrying.

Catherine Ramsay @cramsay2010 · 14 Std.

As I've already pointed out to Clare NZ & Australia with few cases yet doing huge numbers of tests there are few positives. e. g. recent data from Victoria clearly shows the utility of PCR and that false positives are NOT a problem.

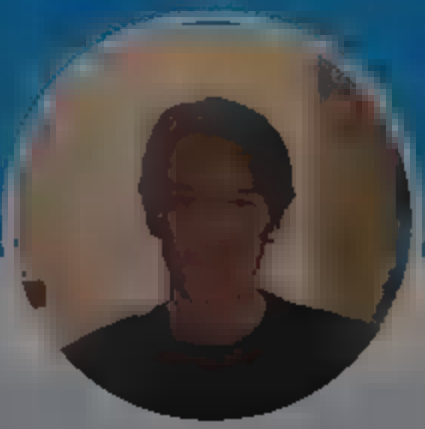
Antwort an @cramsay2010 @tomyoung79 und 2 weitere



Things look in better shape there but please: there is not expected to be any linkage between false positive rates in one place & another. This because only a few of the sources of error sit inside the PCR test itself. The rest are outside & are wholly down the local factors.

There is observed astonishing and unexpected correlation between numbers of tests performed and positivity, across several areas in U.K. That alone rather shouts 'testing problem', but the main issue is the disproportionately low excess deaths.

Antwort an @kennyhegney @bbclaurak

He doesn't need to isolate. He's had the virus & along with the majority in U.K. he's now immune.
Immune not only protects him, but others from transmission, which halts in the immune (for the same reason; acquired immune response prevents run away growth of virus).

Antwort an @charding592 @bbclaurak

I had heard they can enter through the eyes but it's not an area i know about.
Surgeons don't need to wear masks in surgery to protect straightforward patients. Proven decades ago. They use them to prevent blood entering mouth & nose.

No evidence of just one agent. Flu has never done it since. 102y old guesses wont do.
And this is a virus of a different group.
More recently SARS1 performed one wave per location.
The last apparent 2nd wave, swine flu 2009, turned out to be a PCR false positive pseudo-epidemic.

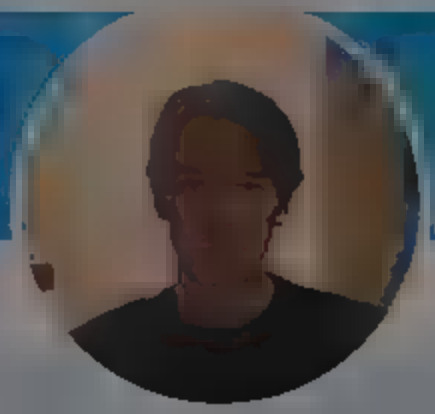
I can't be sure; not a pathologist. I'm told there's evidence of some deaths where the clinical picture does match spring but an enormous number (of covid19 deaths) which don't.



I think a degree of endemicity is plausible, but it's not a public health crisis even where present.

If "cases" are predominately false PCR test results, the decrease being observed must be due to a directly proportional reduction in the PCR test's false positive rate. This seems unlikely, but it's either that or more data manipulation and sophistry.

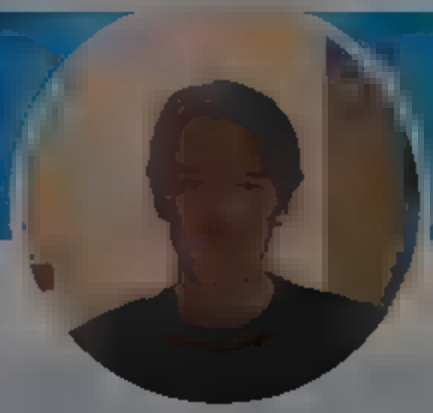
Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @Max230809 @CovidSenseBloke @bbclaurak

I'm not as up on testing data as others, but another route to reduction is running fewer tests.

Joel Smalley just tweeted an astonishingly tight positive linear correlation between number of tests run in a day & positivity.



I can't explain that via normal routes. Thoughts?

PCR false positive pseudo-epidemic.

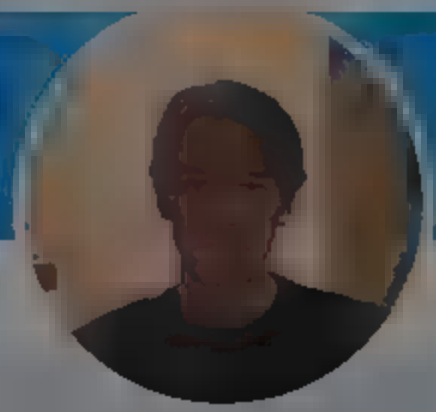
34 202 764

Nic Allan @nicallansound · 1 Std.

A second wave was coming because the first one was suppressed by lockdown and summer. Seasonality of viruses and relaxing of lockdown was always guaranteed to produce a second wave of some extent.

3 3

Yardley Yeadon @MichaelYeadon3 · 38 Min.



Also, while I'd agree with you if wave was small, the cases data beggars belief. It's lost all connection with reality, including symptoms. Cases shot like a scalded cat as respiratory symptoms on Zoe, NHS111 & A&E respiratory attendances all fell. Deaths have wrong Clin picture

1 1

Nic Allan @nicallansound · 29 Min.

I agree cases wildly inflated by PCR &severity of current situation is questionable.It's the extent of your refutation of suppression & denying any presence of 2nd wave I can't get onboard with.I know vulnerable who have literally hidden since Feb. Isn't that suppression?

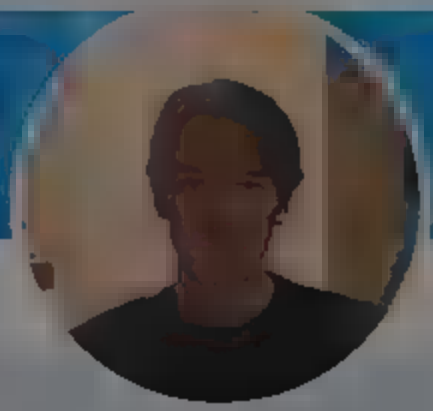
Maybe it's terminology? I'm fine with #SecondaryRipple
That's what I think is reasonable from a small degree of suppression.



Did you know SAGE prediction for 2nd wave is TWICE the number of deaths in spring 2020? It's that which I'm vehemently disputing. Does that help at all?

Taken to an absurd extent, of course.
Close contact is required.
It doesn't follow though that because Govt says we've had a 'lockdown' that any extent of inhibition of transmission has occurred. In spring for example, we had 'leaky lockdown'. People went to work. Shopped daily.

The need for testing was temporary. Yet it was swept out from 44 NHS labs, with skilled & accredited staff who'd run PCR already. New labs were created outside of the help & control network of the Institute of Biomedical Sciences. They're still not fully accredited to ISO 15189.

I wondered why the top of the scale is limited to 100 per 100k? Is that not = 1:1000 or 0.1% (or greater, of course)?
If the upper limit is set to 1%, how then does the pattern look?
In U.K. we have towns with prevalence by PCR of 15%! (150x greater than 100 per 100k).

Is it just me who recoils in utter disbelief at the claimed levels of positivity?
They're just implausible.
What's a typical peak, instantaneous prevalence in a respiratory virus epidemic.
Low single figure %?
We have hit an improbable 20% in some towns. That's a testing problem.

...so well. But that also applies to vaccine induced immunity too. The oldest often derive least benefit from 'flu vaccines too. And early vaccine trials usually exclude subjects of great age. So you end up with little to no data about safety & efficacy in the pop you most want..

21:08 - 27. Nov. 2020

1

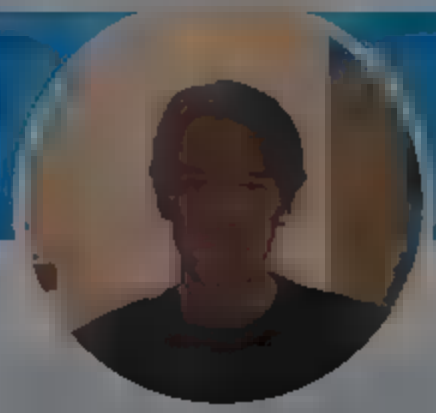
Concerned Citizen (CeeCee) @False_Posttive · 56 Sek.

Antwort an @MichaelYeadon3 @Cakefac87136984 und 2 weitere

Did you ever get a reply from @MattHancock, regarding your vaccine letter?

R&D.

I have read the consultation document. I've rarely been as shocked & upset.



All vaccines against the SARS-COV-2 virus are by definition novel. No candidate vaccine has been in development for more than a few months.

If any such vaccine is approved for use under any circumstances that are not EXPLICITLY experimental, I believe that recipients are being misled to a criminal extent.

This is because there are precisely zero human volunteers for whom there could possibly be more than a few months post-dose safety information. My concern does not arise because I have negative views about vaccines (I don't). Instead, it's the very principle that politicians seem ready to waive that new medical interventions at this, incomplete state of development- should not be made available to subjects on anything other than an explicitly experimental basis. That's my concern.

And the reason for that concern is that it is not known what the safety profile will be, six months or a year or longer after dosing.

You haven't corrected that graph for date of occurrence vs date of report.
It important: it looks like an increase but it's an artefact.
Always appears excess deaths are about to take off, but they haven't. Despite thousands of "covid19 deaths".

And not specific

1 1 19

Dr. Thomas Binder, MD @Thomas_Binder · 4. Apr.
The PCR-Test on #SARSCoV2 has not been validated, which is not only medical malpractice, but utterly insane. And for epidemiological purposes it is COMPLETELY WRONG!
In the latter context you need to check anti-virus-antibodies (IgM & IgG) in the blood.

96 1,2 Tsd. 1,7 Tsd.

#InterferonAlfa2B @Krapocho · 26. Nov.
First, thanks a lot for your work. Do you have any source to show that it's not been validated? Thanks

Covid Fact Check UK @fact_covid · 5 Std.

Why is there so much focus on false positives with these tests, but not nearly as much on false negatives?

Is it not accepted that lateral flow tests return considerably more false negatives than false positives?

10 1 6

Grayphil @grayphil27 · 4 Std.

Why are we testing at all, if the tests aren't fit for purpose.
If PCR and LFT tests give 2 completly different answers, they should not be relied upon to decide if our livelihoods are put at risk.
End of.

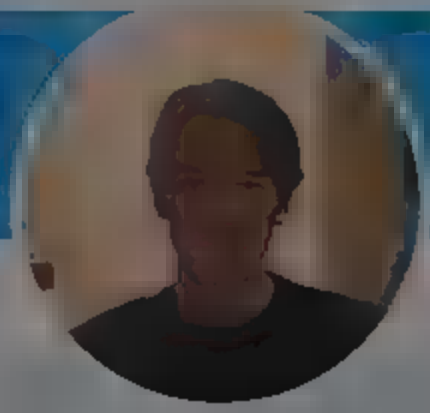
1 3

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @grayphil27 @fact_covid und 2 weitere

LFT is validated. We know sensitivity & specificity. We can interpret a positive result.



PCR isn't validated. We've no idea what the operational false positive rate is. Thus we cannot interpret a positive result.

PCR is a menace & mass testing should cease immediately.

I got that email 🤣🤣🤣

There are three vaccination volunteer roles to choose from and you will be provided with NHS-approved training by St John Ambulance. As an NHS Volunteer Responder, you can begin your application with your GoodSAM Responder app login details.

- **Volunteer Vaccinator** - Under the supervision of healthcare professionals, Volunteer Vaccinators will be trained to deliver a vaccination to a patient. They will also be ready to act if a patient has an adverse reaction

- **Vaccination Care Volunteer** - This role will support patients all the way through, from arrival to discharge. They will help patients get to the right place to receive their vaccination and provide first aid if anyone has a medical emergency

- **Volunteer Patient Advocate** - This role will concentrate entirely on the welfare of patients, potentially looking after people and small groups all the way through the vaccination centres. If anyone has a medical emergency, a Volunteer Patient Advocate will be able to recognise it and get help quickly

These roles are managed by St John Ambulance and can be done alongside your existing role as an NHS Volunteer Responder. A further role as a venue steward will be available to NHS Volunteer Responders

2

I got that email 🤣🤣🤣

> There are three vaccination volunteer roles to choose from and you will be provided with NHS-approved training by St John Ambulance. As an NHS Volunteer Responder, you can begin your application with your GoodSAM Responder app login details.
>
> - **Volunteer Vaccinator** - Under the supervision of healthcare professionals, Volunteer Vaccinators will be trained to deliver a vaccination to a patient. They will also be ready to act if a patient has an adverse reaction.
> - **Vaccination Care Volunteer** - This role will support patients all the way through, from arrival to discharge. They will help patients get to the right place to receive their vaccination and provide first aid if anyone has a medical emergency.
> - **Volunteer Patient Advocate** - This role will concentrate entirely on the welfare of patients, potentially looking after people and small groups all the way through the vaccination centres. If anyone has a medical emergency, a Volunteer Patient Advocate will be able to recognise it and get help quickly.
>
> These roles are managed by St John Ambulance and can be done alongside your existing role as an NHS Volunteer Responder. A further role as a venue steward will be available to NHS Volunteer Responders

Rich @rich_mellish · 13 Std.
How can it be - that's higher than the total positives!

2 16

Jonathan Engler @jengleruk · 8 Std.
Not in some areas it's not. But let's say the FPR is as low as 5%. With 20% FNR and prevalence of 1% 86% of positives are misdiagnoses.

To put 1% into context, the government infection pilot estimated prevalence at 0.27% between 27 April to 10 May - during a real pandemic.

2 2

Professor Ben @benp7777 · 6 Std.
so the final operation FRP could be 86%, Jon?

Mark R @ManosDePiedra86 · 1 Std.
If Jon was right, you'd see his numbers reflected in ONS survey data. They use the exact same labs.

Guess what? They aren't.

The actual FPR is closer to 0.05% than it is to 5%.

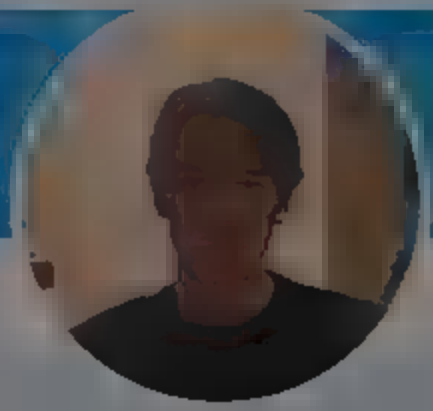
3 10

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @_markross @ThomasAcworth und 2 weitere



It varies day -day bc the biggest contributor to it is in the steps prior to PCR. Ignore the values within PCR itself. They're small. Cross contamination is the key. It's inevitable at industrial scale. And they're not even checking for it.
All will be revealed in next paper.

May I ask why you're discourteous?

Specific challenges are best way to get to the truth.

That's all I've ever sought to do.

...assumed because the balance to HI comes from infection followed by immunity. The profile of deaths vs time indicate HI.
So I disagree entirely with your contention.
The case there's a major problem with PCR mass testing rests upon multiple, individually strong foundations.

Labour's abstention today is interesting. They should oppose as should all MPs. There's no evidence of a public health crisis nor that one is imminent. Even early in winter, some areas experience pressures on the NHS. That's neither new nor a justification to restrict activities.

Science is dead as a discipline. 'Experts' can assert whatever they like & are not open to challenge or even a respectful request. I've asked privately & I've asked in articles & asked here. It's all our lives. No one in the 'expert' Grp has courtesy to point to lit they've used.

Title: Subsequent waves of viral pandemics, a hint for the future course of the SARS-CoV-2 pandemic..

Authors: Fabian Standl, Karl-Heinz Joeckel, Bernd Kowall, Boerge Schmidt, Andreas Stang

medrxiv.org/cgi/content/sh...

Subsequent waves of viral pandemics, a hint for the future course of the SARS-CoV-2 pandemic.

FABIAN STANDL, KARL-HEINZ JOECKEL, BERND KOWALL, BOERGE SCHMIDT, ANDREAS STANG

Background It is unknown if the SARS-CoV-2 pandemic will have a second wave. We analysed published data of five influenza pandemics (such as the Spanish Flu and the Swine Flu) and the SARS-CoV-1 pandemic to describe whether there were subsequent waves and how they differed. Methods We reanalysed literature and WHO reports on SARS-CoV-1 and literature on five influenza pandemics. We report frequencies of second and third waves, wave heights, wavelengths and time between subsequent waves. From this, we estimated peak-to-peak ratios to compare the wave heights, and wave-length-to-wave-length ratios to compare the wavelengths differences in days. Furthermore, we analysed the seasonality of the wave peaks and the time between the peak values of two waves. Results Second waves, the Spanish Flu excluded, were usually about the same height and length as first waves and were observed in 93% of the 57 described epidemic events of influenza pandemics and in 42% of the 19 epidemic events of the SARS-CoV-1 pandemic. Third waves occurred in 54% of the 28 influenza and in 11% of the 19 SARS-CoV-1 epidemic events. Third waves, the Spanish Flu excluded, usually peaked higher than second waves with a peak-to-peak ratio of 0.5. Conclusion While influenza epidemics are usually accompanied by 2nd waves, this is only the case in the minority of SARS-CoV1 epidemics.

Interesting piece if work, thank you.
I've been known to say "viruses don't do waves".
The main reason I say this is to taunt SAGE so that one of them develops sufficient testicular fortitude to come & justify they're predictions & to debate the foundational literature.

First, the key restriction to my general rule has two components.
-not change it's immunological appearance (like flu, otherwise it's questionable whether it's really a new variant or even a new virus. If either, the 2nd & subsequent waves are arguably really 1st waves.

-not be toxic to the immune system (I know HIV isn't a respiratory virus but it serves to make the point, if there is immunosuppression, it can reattack people without limit).

Setting aside those, we're left with SARS-CoV-1.

Mark Toshner @mark_toshner · 17. Nov.
That we can do amazing things (necessity being the mother etc). These trials have been nothing short of miraculous, revolutionary but in the context perhaps it is not surprising given our ability to innovate when we REALLY need to...5/n

13 278 5,4 Tsd.

Mark Toshner @mark_toshner · 17. Nov.
and we really needed to. Safety hasn't been compromised. 100s of thousands of great people volunteered for experimental vaccines. The world watched closely. The press reported every serious adverse event. There have so far been a handful. A triumph of good people/good process.

28 330 5,3 Tsd.

Mark Toshner @mark_toshner · 17. Nov.
I am confident that when regulators and scientists pour over the safety data (and we will because we are a bit that way inclined) that vaccines will only be used if we are confident that the risk is definitively outweighed by benefit. This should give you confidence too.

315 522 8,8 Tsd.

Antwort an @mark_toshner

Mark, I've spent 32y in pharma & biotech research & early development.
My main concern is we've misinterpreted what is merely the status at 1st interim analysis as "the final results". They're def not final. Becoming PCR positive is not illness & unlikely to be a good surrogate.

Stuart Allan @StuartA05729349 · 6 Std.
So does this chart suggest that we are labelling a significant number of non-COVID deaths as COVID?

6

Joel Smalley @RealJoelSmalley · 5 Std.
Absolutely it does.

1 1

fiona bottomley @BottomleyFiona · 25 Min.
And how is this happening? How are these deaths being mislabelled?

1

Yardley Yeadon
@MichaelYeadon3
Folgen

Antwort an @BottomleyFiona @RealJoelSmalley und 4 weitere

Isn't one very large factor that death from any cause within 28d of a positive test is labelled covid19 death?
That alone raises covid19 higher than is reasonable, but on top there's very strong evidence of a high proportion of positives being false at this time, worse than ever.

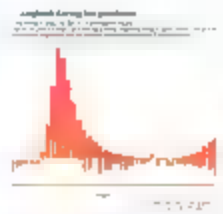
What upper bound is this? Because ONS is very clearly above the 5 year average, and even adjusting for population growth above the 5 year average now?

3 2



Joel Smalley @RealJoelSmalley · 11 Std.

ONS presents by date of registration. Faulty metric. Corrected date of occurrence is the reliable metric.

2 9

JM Pienaar @PienaarJm · 9 Std.

Please refer to the explanation in this thread.
You are basing your opinion on incomplete data.

Colin Angus @VictimOfMaths

...this explains the apparent 'mirroring' you can see in this graph of excess deaths by cause and date of occurrence in recent weeks. COVID-19 deaths get registered quicker, while other cause deaths take longer, so show a…

I know that Joel has a historical data based adjustment so it's not incomplete (if that's what you meant...well aware that deaths by occurrence leaves gaps, but these can be reliably filled in).

If you were required to show the full set of vaccinations against a range of diseases which could be transmitted in such a setting, including flu, it might make sense. But choosing one virus of little risk to most people is absurd. It's a lesser risk to the young than is flu.

Scott Atlas - T-cell immunity youtu.be/P_BR_dkBuHw via @YouTube
Shame Dr Atlas resigned because here's a public official who's read & understood the latest scientific literature.
In U.K. we too heard "more than 90% of the pop remains susceptible". How are all so uninformed?

60 397 1,3 Tsd.

Fairbrit @wealdengirl · 13 Std.
Did Dr Atlas resign or was he told to leave? I say this because he quotes all the Great Barrington Declaration experts, and the media and govts are besmirching that strategy as well as the eminent scientists who co-authored it. I trust Dr Atlas, but I wonder why he resigned.

Yardley Yeadon

Folgen

Antwort an @wealdengirl @YouTube

Unlike in U.K. where we have a permanent civil service, in the USA, advisors are appointed by the Administration. I think he resigned once it was clear that Trump had conceded. I don't know if that's the reason. Just a shame that a senior & well informed person has left.

It does feel odd that some people appear to think that those who've spent 100s, in my case well over 1000 hours of free time, researching & writing about this slow motion train wreck, are somehow paid actors.
I wouldn't do that even if offered a million pounds. Or ten million.

I'm one of the authors. I've enjoyed a career in big pharma & biotech finishing as CEO. After selling the biotech to Novartis in 2017 (Ziarco, look me up) I'd settled into a little, light consulting. No one paid me to give up my entire life for 7 months to fight this nonsense.

Dr. Thomas Binder, MD
@Thomas_Binder

Follow

It is nonsense to test every symptomatic person for a (single) "flu virus". It is madness to do this with a not very specific rt-PCR test only, without consideration of Ct and clinical findings. And it is the coronation of insanity to test even asymptomatic people in this way.

Dr. Thomas Binder, MD @Thomas_Binder
The test is the disease, not the virus!

During my entire life we have never tested for any cold virus except when specific therapy was needed....

Es ist Nonsens, jeden symptomatischen Menschen auf ein (einziges) "Grippevirus" zu testen. Es ist Wahnsinn, dies nur mit einem wenig spezifisch PCR-Test zu tun ohne Berücksichtigung von Ct & Klinik. Und es ist die Krönung des Wahnsinns, auch asymptomatische Menschen so zu testen.

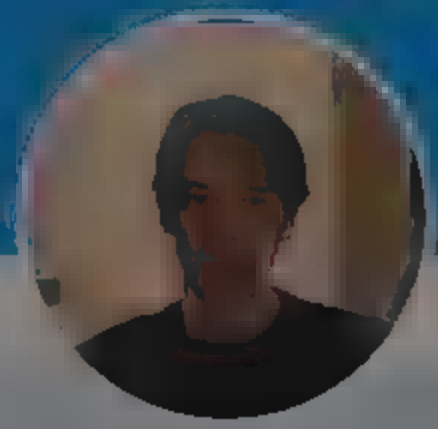
This is great. The first time the notion of "asymptomatic transmission" was mentioned, I smelled a rat. It's biologically implausible. Not saying it's never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

ARTICLE

https://doi.org/10.1038/s41467-020-19802-w OPEN



Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2,3✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COVID-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,474 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

Why would you want to prevent human to human transmission of SARS-COV-2, provided the humans involved aren't vulnerable to severe outcomes?
Ans: you wouldn't. On the contrary, every such event reduces the remaining susceptible population & increases protection of the vulnerable.

WHO-2019-nCov-IPC_Masks-2020.5-eng.pdf

- The World Health Organization (WHO) advises the use of masks as part of a comprehensive package of prevention and control measures to limit the spread of SARS-CoV-2, the virus that causes COVID-19. A mask alone, even when it is used correctly, is insufficient to provide adequate protection or source control. Other infection prevention and control (IPC) measures include hand hygiene, physical distancing of at least 1 metre, avoidance of touching one's face, respiratory etiquette, adequate ventilation in indoor settings, testing, contact tracing, quarantine and isolation. Together these measures are critical to prevent human-to-human transmission of SARS-CoV-2.
- Depending on the type, masks can be used either for

- In areas of known or transmission health where patient are p medical mas This medical mas g for

Prof Francois Balloux @BallouxFrancois · 47 Min.

I don't believe Wodarg and Yeadon have been misquoted. The article strikes me as a fair summary of the petition they filed to the European Medicines Agency to ask for ongoing #SARSCoV2 vaccine trials to be stopped with immediate effect. 2020news.de/wp-content/upl… twitter.com/WWakeUpTime/st…

> **XI.** Several vaccine candidates are expected to induce the formation of humoral antibodies against spike proteins of SARS-CoV-2. Syncytin-1 (see Galleher, B., "Response to nCoV2019 Against Backdrop of Endogenous Retroviruses" - http://virological.org/t/response-to-ncov2019-against-backdrop-of-endogenous-retroviruses/396), which is derived from human endogenous retroviruses (HERV) and is responsible for the development of a placenta in mammals and humans and is therefore an essential prerequisite for a successful pregnancy, is also found in homologous form in the spike proteins of SARS viruses. There is no indication whether antibodies against spike proteins of SARS viruses would also act like anti-Syncytin-1 antibodies. However, if this were to be the case this would then also prevent the formation of a placenta which would result in vaccinated women essentially becoming infertile. To my knowledge, Pfizer/BioNTech has yet to release any samples of written materials provided to patients, so it is unclear what, if any, information regarding (potential) fertility-specific risks caused by antibodies is included.

Of course not the only grounds. You can read them in the summary.
A series of concerns, coupled with speed, added to which an unusual response from the authorities (who appear keen to vaccinate well beyond the vulnerable pop) add up to cause me anxiety.
Have you none, yourself?

To put it simply many people see through the lies of our govt., which leads people to seek answers and Yeadon is qualified to speak on the matter so gets attention.

What's your take on Valance's GSK shares?

1

Mark R @ManosDePiedra86 · 9 Min.
Every scientist, at that level, has shares somewhere, or conflicts somewhere else. If they aren't hidden, and the actual information presented is sound, things like that shouldn't matter too much. It's not ideal, but also unavoidable. There are conflicts on both sides.

2

Mark R @ManosDePiedra86 · 5 Min.
...massively above actual observed positive rates, and claims about specific vaccine ingredients that were disproven over a decade ago.

Some of Yeadon's underlying theory makes sense (not all), but some of his extrapolations make many of his claims utterly ludicrous.

Francois, sequence homology is not long but it is there. For example VVNQN vs VVLQN in CoV-2 vs Syncytin-1. There are others. While not striking, 'what if' a polyclonal response includes cross-reacting antibodies? And motifs this small can give rise to cross-reacting antibodies.

7 18 73

Prof Francois Balloux @BallouxFrancois · 1 Std.

I believe the very limited regions of homology between #SARSCoV2 spike and Syn1 are too short/imperfect to be of concern. A minimum of ~≥8-10 adjacent matching AAs, or ~≥12-15 AAs with ~≥66% homology are required for cross-immunity (Abs, CD8+ and CD4+). No region qualifies.

Chuanzhu Lv[10,12], Fujian Song[2,12], Xiaoxv Yin[1,12] & Zuxun Lu[1,12]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

...and don't transmit it again".
This really is big news to immunologists.

Most acute viral infections confer life-long immunity, mediated by a combination of local and systemic antibody responses, and cell-mediated immunity. Re-exposure at any interval after initial infection then results in (a) a re-infection with minimal virus replication, or (b) an anamnestic immune response. Such re-infections are frequently covert, and result in minimal shedding of infectious virus. For certain viruses, such as poliovirus or rhinovirus, immunity is type-specific and confers little protection against exposure to a different serotype. These facts have implications for respiratory viral epidemiology, as a population may therefore be divided into susceptible and immune subjects. Immune subjects are largely exempt from disease and are inefficient links in a transmission chain, whereas susceptible

changes in humidity, barometric pressure, winds, precipitation and drought. These factors can affect infectious disease agents directly. Many viruses in the free state are vulnerable to heat, radiation and drying.

Overall, respiratory infections are more frequent in the colder months but within this period there are considerable variations in the relative prevalences of the individual viruses. Rhinoviruses, for example, peak in early and late winter, while influenza viruses are most active in midwinter, and at least in the UK, RS virus has a well-defined peak in mid–late winter. Both older and more recent studies have highlighted the strength of the relationship between viral respiratory infections and school term times, suggesting that for rhinoviruses and coronaviruses, the most important factor

2003, they still displayed vigorous T-cell responses to SARS, 17y later. They were also immune to SARS-COV-2.
We can minimise risks, get greater coverage of the most vulnerable & speed progress towards normalisation by NOT vaccinating those symptomatic & had a positive test?

...and don't transmit it again".
This really is big news to immunologists.

Most acute viral infections confer life-long immunity, mediated by a combination of local and systemic antibody responses, and cell-mediated immunity. Re-exposure at any interval after initial infection then results in (a) a re-infection with minimal virus replication, or (b) an anamnestic immune response. Such re-infections are frequently covert, and result in minimal shedding of infectious virus. For certain viruses, such as poliovirus or rhinovirus, immunity is type-specific and confers little protection against exposure to a different serotype. These facts have implications for respiratory viral epidemiology, as a population may therefore be divided into susceptible and immune subjects. Immune subjects are largely exempt from disease and are inefficient links in a transmission chain, whereas susceptible subjects can both spread the agent and experi-

changes in humidity, barometric pressure, winds, precipitation and drought. These factors can affect infectious disease agents directly. Many viruses in the free state are vulnerable to heat, radiation and drying.

Overall, respiratory infections are more frequent in the colder months but within this period there are considerable variations in the relative prevalences of the individual viruses. Rhinoviruses, for example, peak in early and late winter, while influenza viruses are most active in midwinter, and at least in the UK, RS virus has a well-defined peak in mid–late winter. Both older and more recent studies have highlighted the strength of the relationship between viral respiratory infections and school term times, suggesting that for rhinoviruses and coronaviruses, the most important factor controlling the seasonal variability in incidence is the increased congregation of pre-

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

their most infectious. Lateral flow tests detect individuals in their most infectious period. PCR tests can identify people for much longer periods and are the best test to use if individuals have symptoms so that we can ensure they get the treatment they need.

That's not my reading.
If PCR tests are positive, with cycle thresholds associated with ability to 'culture' virus from the sample, the LFT finds it positive.
If OTOH PCR tests are positive at high Ct, most accept that's really a negative. LFT concurs.
There's more trouble...

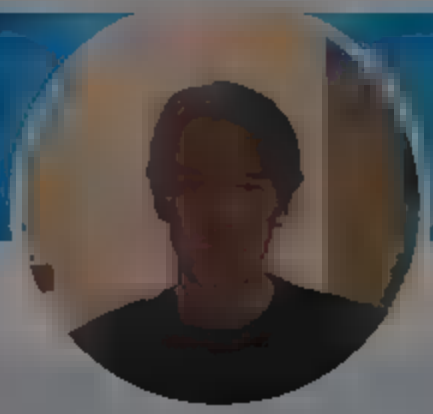
...from false positives associated with unregulated high Ct PCR then any other technical factor I can think of all year.
I love PCR. I'm sceptical about this PCR protocol; more so in industrialised mass testing mode, for which it's inventor made repeatedly clear its unsuited.

2 6 19



Alex Faulkner @hearthefalconer · 6 Min.

If LFTs are accurate in detecting high viral loads, isn't that all we need to worry about anyway? The mass testing of Liverpool shows 99.4% tested negative (around 700 out of 110k), doesn't that show herd immunity?

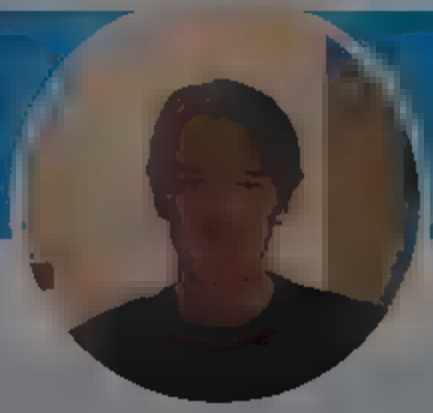
The first time I smelled a rat in all of this was when the UK Government did that big u-turn and made mask wearing mandatory.

2 1 10



Mark Eaton @Markeaton999 · 9 Min.

Funny thing is, I wore one every time I went to the supermarket during April/May. That's when the government was telling us not to bother with them. I stopped sometime in June, when I realised the pandemic was basically over. That was around the time they made them mandatory.

The Diplomat @TheDipl57726439 · 4 Std.
I heard on the radio this morning someone claiming that 50% efficacy was considered acceptable for a vaccine. How can this be? If in a trial of 1000, 500 receive the vaccine and 500 the placebo, 10 each on both sets catch infection, that's 50% efficacy but vaccine has no effect

1 3

Man Named Bob @man_named_bob · 3 Std.
That would be an efficacy of 0%

The Moderna vaccine trial showed 94.1% efficacy. This was based on 185 cases in the placebo group and 11 in the vaccinated group. 11 / 185 * 100 = 94.1%

Off the same 185 placebo cases a 50% efficacy would have around 92 in the vaccinated group.

Antwort an @man_named_bob @TheDipl57726439 @AllysonPollock

With efficacy, we think severe illness reduced (I do, anyway. No one cares if mild disease is reduced). By that measure, none of the vaccines have shown efficacy. I'm stunned that MHRA approved the PFE agent. Based on what? After 30y in the industry, I'm ashamed of our regulator.

This is just embarrassing.
You've no shame, any of you.
You mostly know nothing, you rely on people lacking crucial skills, you tie yourselves up in destructive group think. I wouldn't mind if you inflicted it on you. But no, you've smashed up the lives of tens of millions.

But there is more. Though there is some overlap, it's certainly true that the youngest among of us less commonly get infected, symptomatic or severely ill, so even if we're picky, we could tajes just 5% of the total population from mid-teens % whom make up the category 'children'

Absurd that the likes of @ClareCraigPath were trying to suggest LFT should be used to verify PCR.

3 7

Lesley Johnson @LesleyLelly88 · 2 t
So you think the PCRs mass tested by untrained staff in makeshift labs at a Ct of 45 is good practice?

1 1

Stop Coronavirus Nonsense @StopCoronavir12 · 2 t
A) they are trained
B) while they go up to ct40+ they're only called +ve at ct<35 which is a level at which it's suggested by a variety of papers that the subjected is likely to have transmissible levels of viral material.
So in answer to your question...yes.

In Lighthouse Labs, training includes being shown liquid handling by a 'pipette trainer'.

This isn't training. Those who skill level is so low they need to be taught how to use pipettes are not suitable.

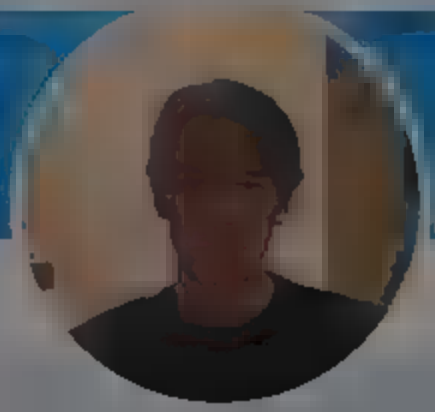
Quite. WHO recently estimated 750m had been infected. If only 99.99% became immune, 75,000 people would be immune to re-infection. I'm not sure they've found 100 worldwide. Immunodeficiencies occur at much higher frequency than this.

Most acute viral infections confer life-long immunity, mediated by a combination of local and systemic antibody responses, and cell-mediated immunity. Re-exposure at any interval after initial infection then results in (a) a re-infection with minimal virus replication, or (b) an anamnestic immune response. Such re-infections are frequently covert, and result in minimal shedding of infectious virus. For certain viruses, such as poliovirus or rhinovirus, immunity is type-specific and confers little protection against exposure to a different serotype. These facts have implications for respiratory viral epidemiology, as a population may therefore be divided into susceptible and immune subjects. Immune subjects are largely exempt from disease and are inefficient links in a transmission chain, whereas susceptible subjects can both spread the agent and experi-

changes in humidity, barometric pressure, winds, precipitation and drought. These factors can affect infectious disease agents directly. Many viruses in the free state are vulnerable to heat, radiation and drying.



Overall, respiratory infections are more frequent in the colder months but within this period there are considerable variations in the relative prevalences of the individual viruses. Rhinoviruses, for example, peak in early and late winter, while influenza viruses are most active in midwinter, and at least in the UK, RS virus has a well-defined peak in mid–late winter. Both older and more recent studies have highlighted the strength of the relationship between viral respiratory infections and school term times, suggesting that for rhinoviruses and coronaviruses, the most important factor controlling the seasonal variability in incidence is the increased congregation of pre-

Yardley Yeadon
@MichaelYeadon3

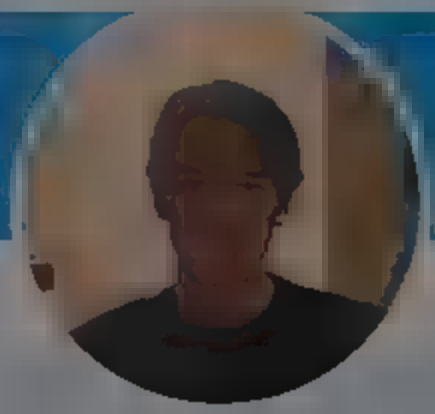
Folgen

Antwort an @NYC2SN1

That's regrettable, since I'm convinced by the data that we're already there. The bulk of the herd immunity was in place by June.



We've permitted a rotten PCR test, made worse by industrialising it in Lighthouse Labs, to needlessly steal another 5mo & counting of our lives.

I think the logic is that we cannot know if, on each occasion, the vaccine has 'worked'. Of course, it's not necessary. Let's assume those vaccinated are protected. Once the vulnerable are vaccinated, it doesn't matter if others can transmit. That's how 'flu vaccination works.

Curious Sceptic @Bernp1953P · 3 Std.
How can it not prevent transmission if it does prevent infection?

2 1

Jonathan Engler @jengleruk · 3 Std.
It hasn't been shown to prevent infection. That's the point. It has only been shown to reduce the severity of symptoms. (Flu vaccine is the same btw.)

Symptom reduction MAY reduce transmission, although if it stops people self-isolating it may not. Regardless, that's unknown.

Antwort an @jengleruk @Bernp1953P

Jonathan, I don't think it's been shown to reduce symptoms of Covid19. If you look at the endpoint description, ANY symptom passes, one cough, a sore throat, anything. They assumed it was Covid19. But there are >100 viruses which produce these symptoms.

To your second question, with respect, how the hell would I know?
That's not a science question. So, I don't know.
But please: it's not necessary to know motives in order to observe & conclude they're in error, badly.
Many have done that work. They are indeed in error, badly.

Indeed. We have to deal with the situation in hand first as it is blatantly misleading and is causing deaths and irreparable damage. If we focus on the 'why' now we will lose our chance to intervene and reveal what is going on and hopefully stop it

Why would you trust the word of a few individuals? As I've said, if they believe what they - and you - are told, naturally their testimony lines up.
Anecdote is not data & you'll better understand the position if you look at representative information.
That doesn't line up.

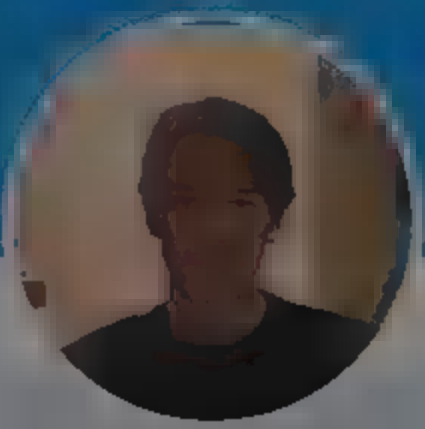
Surely those who are working directly on the frontline are best placed to have an opinion on what they're seeing in patients? (I have lots of friends who work in hospitals, and follow many more hospital professionals on here). I recognise that there are false +ve (& false -ve!)



1

Gemma Elizabeth @202ac087422e48c · 1 Std.
But there are large numbers of patients who are presenting with COVID symptoms and +ve tests! I don't understand how the frontline workers lived experience and clinical judgement is wrong, but people who have never stepped foot in a covid ward, are right?

But if they had made the criterion infection including asymptomatic everyone would be bleating about PCR false positives. Symptoms plus PCR is really the best criterion to have used, and implies if not proves that it will also reduce infection and transmission.

1

Replying to @gadboit @jengleruk @Bernp1953P

I buy that, if the symptoms used were pathognomic. But they used any symptom, no matter how slight, symptoms produced by a large number of viruses. PCR unless at low cycle thresholds isn't even good evidence of presence of infection. As you know, we've had this debate all year.

Replying to @MichaelYeadon3 @jengleruk @Bernp1953P

Yes, it seems to me that if the virus you're PCR testing for is what's _causing_ the symptoms you should be positive at a low cycle threshold. So no need to crank it up to 45 (if there is ever a good reason to do that which I doubt).

All you need to realise the pandemic is long over, there's no PH emergency & that community immunity makes it impossible for SARS-COV-2 transmission to be occurring as we're told it is. We're in a PCR false positive pseudo epidemic. It'll stop only when PCR mass testing stops.

In light of this (which has been understood for quite some time now) & with the possibility this may remain the case, it must surely be vital to understand the true extent of asymptomatic spread of SARS-CoV-2 to better inform future public health policy. Yes? No?

Personally, I regard that as all far too late. The virus, which is more contagious than 'flu, has been circulating in U.K. for at least ten months. No evidence NPIs made any difference to transmission. Good evidence it's spread completely to all corners of the nation, long ago.

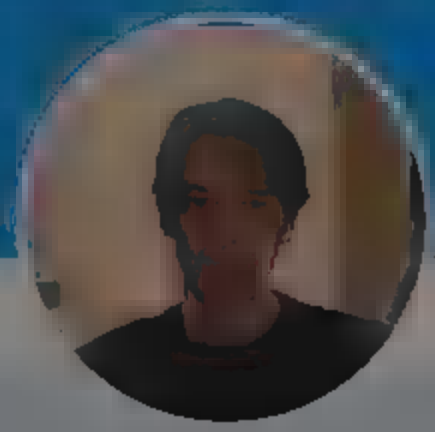
Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2,3✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]



Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apnl 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

I'm sorry that they're overworked. PCR mass testing is responsible for very large numbers of NHS staff being made to self isolate, in most cases needlessly, resulting in a staffing crisis. Where it comes to believing their patients are seriously ill with Covid19, some may be.

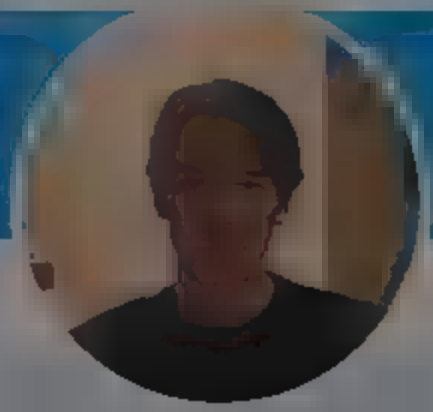
But the majority are not ill with Covid19. The thing about pseudo-epidemics is that, the those involved at the sharp end, it looks entirely like the real thing, but it isn't. Also, anecdote isn't data. That why I ask you & friends to look at country-wide data. Then it's clear.



4 4 37

Gemma Elizabeth @202ac087422e48c · 4 Std.
When you say "it looks like the real thing, but isn't", do you mean that they're wrong in their diagnosis based on the clinical presentation of the patients they are treating? Out of curiosity, have you actually spent time treating patients in hospitals throughout this crisis?

It's not been shown even to prevent infection. It has been shown to reduce the propensity to become PCR positive. No details of how they ran the test are published. No evidence they ran full length sequencing, retested with different printers or cultured virus. PCR only.

Those who've been infected are then immune. Of the 750million people WHO estimated had been infected, virtually no one has been reinfected. 0.0001% is 750 people. I don't think there's been that many. So 99.9999% didn't get reinfected, so far.

Those who've been infected are then immune. Of the 750million people WHO estimated had been infected, virtually no one has been reinfected. 0.0001% is 750 people. I don't think there's been that many. So 99.9999% didn't get reinfected, so far.

2 30 153

Yardley Yeadon @MichaelYeadon3 · 4 Std.
"The experts were unanimous in their answer: Covid-19 is by far the more dangerous option".
I disagree. The vast majority of people under 60y (possibly older) are at lower risk of severe outcomes including death than they are from 'flu in an unvaccinated state. We don't yet...

I've not been to India, but is this mandatory? Or advised?
Also, the person getting the vaccine & the person getting the protection are the same. That matters.
If I was 84, I'd be VERY unhappy if others had to accept a vaccine of no value to them as they'd still bear the risks.

Dr Clare Craig @ClareCraigPath · 14 Std.

Testing peaked in all these countries BEFORE cases fell. There are 2 exceptions. In Italy, tests stopped rising on 13th, cases peaked on 13th but tests did not fall until 20th. In Austria, cases peaked on 13th and tests on 18th. Why did they all reduce testing at the same time?

47 57 237

Ian Melding @ianmelding · 13 Std.

Testing is voluntary, there are no mandatory mass testing progs. No one 'reduced testing'. Demand for tests are driven by the public, so when people are locked down they naturally pick up less other bugs that make them think they may have Covid & so less likely to ask for a test

4 4

Ian Melding @ianmelding · 13 Std.

Demand for testing is not the same as testing being 'reduced' and you should be ashamed of yourself for the implications. Look at the comments on this thread

Thanks very much, Prof Semple!

So there's a form of matrix: a traveller must have this doc when arriving in a list of places, but only if they've been to countries with a particular risk status.

A U.K. traveller going to Antigua doesn't need this.

Makes sense. Appreciated.

Antwort an @brianhopkinsmd

Yes, but there's a major problem here.
There have been two truly huge pieces of quality work by large teams, not just examining the extent of T-cell prior immunity, but doing epitope mapping.
The shared epitopes are NOT in spike.
So mRNA vaccines cannot mimic natural immunity.

Brian Hopkins @brianhopkinsmd · 18 Std.
Dr. Yeadon, thank you for everything you do. Question for you: are there any studies you know of showing a vaccine induced T cell response like that you would get with natural infection for SARS-COV2? If not, I have a obvious concerns.

2 2

Yardley Yeadon @MichaelYeadon3 · 23 Min.
Yes, but there's a major problem here.
There have been two truly huge pieces of quality work by large teams, not just examining the extent of T-cell prior immunity, but doing epitope mapping.
The shared epitopes are NOT in spike.
So mRNA vaccines cannot mimic natural immunity.

2

Yardley Yeadon
@MichaelYeadon3

Antwort an @MichaelYeadon3 @brianhopkinsmd

At least, I think that's correct.

That it wouldn't mimic isn't automatically a problem, but it is worth knowing.

Old style vaccines pretty much DO enable all antigens to be presented. They largely DO mimic naturally acquired immunity.

I'll check later & kill tweet if wrong.

Brilliant thread and argument! So is asymptomatic spread a major factor or not?! It's been around long enough they surely must know by now?! And if it's so infectious and spread asymptomatically, surely we've all either had it or been exposed to it & have developed herd immunity?

Antwort an @WarbersB @jengleruk @FatEmperor

Asymptomatic spread cannot be a major contribution to transmission.
Those who argue it is need to explain how, since symptoms (cough, sneeze) are what cause expulsion of infected secretions.

There's a reason humans have evolved to detect illness in others. Can anyone think why?

I am sure that asymptomatic spread is not an issue.

...are 7.5m under 10yo in U.K., or 11%.
Adding 50+15+11 we find 76% now immune.
Even if I'm wrong by 10%, which is possible but unlikely, we're still at herd immunity. This is because the notional value of fraction of a population which must be immune before an outbreak becomes..

1 4 11

Yardley Yeadon @MichaelYeadon3 · 3 Min.
...unsupported / impossible to sustain, 1 - (1/Ro), variously yields for example, 67% if Ro was 3.0.
But this 67% makes a huge & wrong assumption & everyone making these calculations knows it's wrong & it's that there's homogeneity in transmission & susceptibility to infection.

Once heterogeneity is taken into account, herd immunity is reached at far lower fractions of the population being immune. There's no getting away from it: herd immunity is predicted by our own data - even using an IFR which is arguably way too high. If we use an IFR just a...

...wouldn't it be a surprise that there's been not a single, moderated debate between those who broadly share my view & SAGE/Hancock?
I'd agree to do it in a heartbeat.
But they won't, because we've asked / proposed this many times before.

8 8 53

Tom Fenn @tomfenn8 · 33 Min.
I think Mike that this is a Brexit thing. I think you'll have more success after the 31st. The priority for the U.K. right now is to leave the EU and the last thing Johnson and co want now is more bad publicity because SAGE messed up. It's all about politics.

Positive results from PCR testing was used to show the pfizer vaccine is 95% effective. Is this a worry and why are we now told the vaccine doesn't prevent people getting covid but rather reduces the symptoms? What was the point of the much publicised study results?

1 1

Yardley Yeadon
@MichaelYeadon3

Replying to @DewhirstRichard @RealJoelSmalley

The 'results' aren't the results. They're observations available at what's termed the 1st interim analysis. I was aghast to see them called "the results".
Potentially yes, that the only endpoint is PCR positivity. Maybe they did a good job? We don't know as nothing is published.

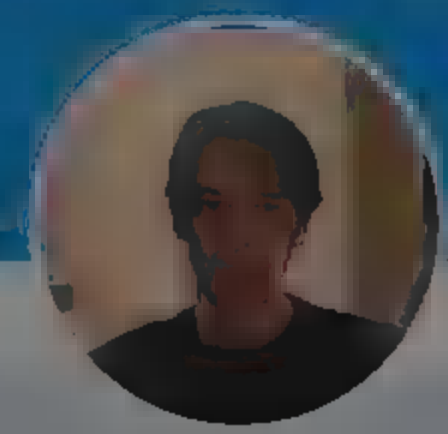
https://doi.org/10.1038/s41467-020-19802-w OPEN



Post-lockdown SARS-CoV-2 nucleic acid scre
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2,3✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COVID-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

Thanks Chris. This direct action is needed. The more who do it, the less it can be ignored, which at present it is.

The grounds used by broadcasters is OFCOM guidelines require they attend only to Govt & their advisors information.

If they're wrong, then what? Who checks them?

I thank Chris Walters @c_walters for attempting to bring to mainstream media attention alternative viewpoints on the basic science.

It's my contention that SAGE has consistently erred. We hear only their advice & pronouncements.

If they're wrong, and they're human, then what?

> **Chris Walters** @c_walters
> Antwort an @Peston
>
> Robert, please have a look at recent threads from @RealJoelSmalley, @ClareCraigPath and in particular @MichaelYeadon3 - these points of view need to be debated in the mainstream as it's clear that due science is not being shared / considered. #NotAConspiracyTheory #BecauseScience

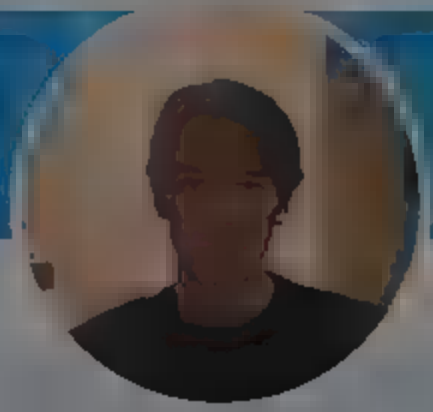
This is great. The first time the notion of "asymptomatic transmission" was mentioned, I smelled a rat. It's biologically implausible. Not saying it's never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

ARTICLE

https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch



Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

There's a lie in the short promo article:

"At 6.31am early riser Margaret, known to friends and family as Maggie, was given the life-saving jab by nurse May Parsons at her local hospital in Coventry".

There's absolutely no evidence it's life saving. Please correct immediately.

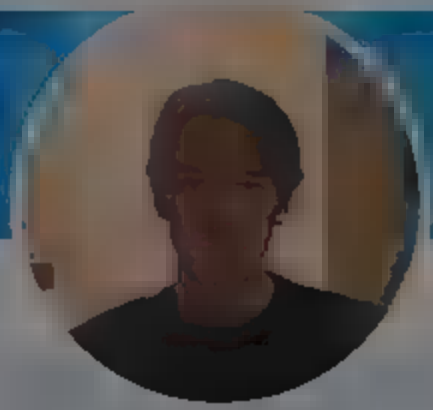
No. I read the full protocol as soon as it was posted online.

What we've heard so far is the 1st of two interim analyses.

So there's this, another next year & completed 2023.



If you'd like help finding the protocol, just say (though I might not see it immediately!).

now we're getting to the point where you try to figure out the difference between determining the efficacy and fully studying a vaccine. I don't have any grounds for thinking you'll manage it.

[Hint for others reading along: "long term effects"]

1 1

Scott McKenzie @srbmckenzie · 50 Min.
You stated it hadn't cleared Stage 3. It has. Yes, it's ongoing, that wasn't in dispute. At no point did I mention long term studies - seen as that would be tricky given the short time that has passed.

1 1

Phil Guthrie @PhilGuthrie · 2 Min.
I'd imagine you don't need to be symptomatic to transfer infection via hands/other fomites, though. No coughing required.
Also, we don't have mass testing. Track and trace generally involves tracing contacts of symptomatic people, and it's proven to work if used effectively.

Hilarious. The scientists that want open debate are the "scientific embarrassments " now are they? How scientific of you Rodney.

1 5

Confirmation Bias @StraightTalki16 · 4 Min.
Yes.

He keeps saying PCR tests are the main cause of + cases. This is completely contradicted by Australia and the results in the UK now of the Nov lockdown.

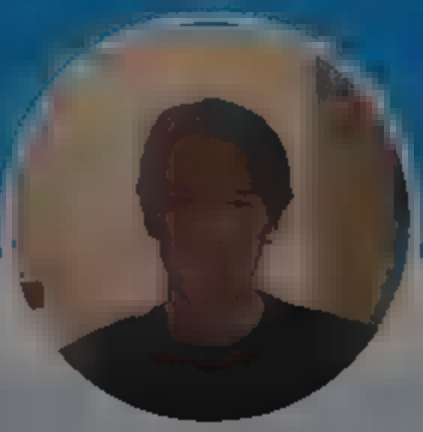
If testing was flawed, cases would correlate with number of tests. This is ignored (to fit his agenda).

1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @StraightTalki16 @Cooper16444223 und 6 weitere



I do believe flawed testing is a major confounder.

But, and an important but: my main conclusions are arrived at quite independent of testing accuracy or not.

Try my thread this morning. Two independent routes to my conclusion (that it's over) which don't rest on PCR accuracy.

Ahe is a simplification, and ignores other comorbidities, such as diabetes or autism. He really should know better about the data on deaths, and what it actually says.

3

Jack Handley @JackHan32443566 · 3 Std.
Never the virus is over. Has said it will always be with us. Still saying herd immunity and there is strong evidence for this, second wave of cases based on mass and I mean mass testing without deaths from covid actually points to a higher immunity among population.

1

Jack Handley @JackHan32443566 · 3 Std.
Look at excess deaths in the UK. They are not like first wave. They are 45 to 65 year olds, at home from diabetes heart disease and undiagnosed cancers. This comes from things like, lack of access to healthcare due to covid. They are not respiratory deaths in hospital setting

The very fact they're publishing cases in the awareness that the test is being run at 45 ct's when you're not infectious or sick over 35 is all the evidence you need that they're not independent or challenging the governments methods.

Antwort an @themood2020 @BriteSponge und 2 weitere

Even 35 reduces the fraction genuinely infectious to low %, I've seen <10%.
It's a error prone test, configured as it is. And used way beyond validated limits is stupid & potentially malign.

Yes, what was it Fauci himself said and may regret now saying but nonetheless.... ' at 35 ct's you have to assume you're picking up dead nucleotides and the chances of viral repetition is miniscule'

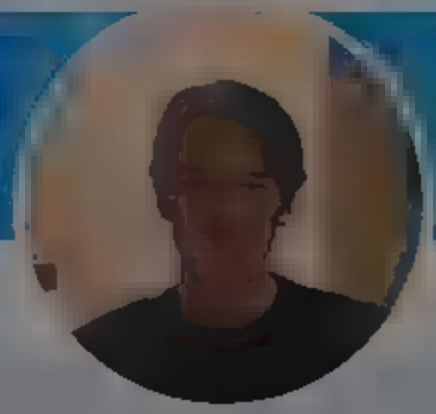
This is great. The first time the notion of "asymptomatic transmission" was mentioned, I smelled a rat. It's biologically implausible. Not saying it's never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

ARTICLE

https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch



Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000. 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

I'm a fan of this approach. Do note, the PCR test is like a car without an MOT. Never been characterised so we cannot interpret a positive result. By contrast LFT has a clean MOT.

The Brexit Party @brexitparty_uk
Whole Government Covid strategy is based on unreliable PCR tests, with big contamination risks. There's growing evidence with accurate Lateral Flow tests, there are far fewer cases.

Caracalla @CaracallaGaius · 49m

"We don't mind if 60,000 people die from the virus as long as it's spread out a bit" isn't the attitude Id be taking. I don't much fancy getting it. I'll be continuing to mask up, socially distance and avoid everything that isn't vital until I get my turn in the vaccine queue.

If you're under 70, the risks to you are LESS than from seasonal influenza.
A little less hyperbole, pls. Son if us would like life to restart before we die of old age. It's not neutral, keeping things repressed like this. Close to a thousand a week avoidable deaths for a start.

But is it true that natural infection & use of the vaccine result in identical immune responses to spike? Not necessarily. The whole virus contains many more immunogenic (foreign) proteins than spike alone. I'd be surprised if the nature & intensity of immune responses to spike..

Wasn't it said by those involved in the vaccine that the immune response or rather antibody response was higher to the vaccine than a natural infection and was portrayed as a good thing? Would have thought that stronger response does not necessarily equal better?

In this case & perhaps for that reason, those not receiving the new vaccine instead were administered a vaccine against an irrelevant antigen.
Single blind isn't best practise, surely?
Perhaps unavoidable without making an 'active placebo' (which can be v difficult)?

Antwort an @stewart_1979 @TiceRichard

Its irksome when uninformed people refer to a data-set in the summer with 0.05% FP rate and so "You're completely wrong, Yeadon". Almost always, the person does not understand the various and varying sources of error and that its not valid to use such examples as they did.

...do not represent a frequency above that expected in the general population.'
I agree with regulators' view, here. I'm a fan of evidence & am neither pro- nor anti-this particular vaccine, big proviso, provided its use is restricted to consenting, highly vulnerable people.

requested to contribute swabs. Based on data from electronic student returns, the mean number of students who actually contributed swabs was **4.8** per testing pool

From a total of **2,256** testing pools across College accommodation, **1,953 (86.6%)** samples were received and processed at the testing facility. Of these, **16** were reported as "void" (for a variety of reasons, including inappropriate packaging and leaking samples).

Combined with the student returns data, we estimate that **9,453** students contributed swabs, including **9,376** students with valid results.

Results

The final pool results were:

Result	Number	%
Positive	10	0.5%
Negative	1,927	99.5%
Total	1,937	100%

Members of all **10** positive pools were invited for individual confirmatory tests. As of Sunday 6th December, all students have been re-tested. Of the positive pools:

- **0** pools were true positives (i.e. included at least 1 student confirmed to be positive on individual testing).
- **10** pools were false positives (i.e. all individual confirmatory tests were negative, following pooled screening test results which were positive at the limit of detection)
- **0** pools have outstanding results

Based on these data, we did not detect any new cases of asymptomatic COVID-19 amongst 9,376 students living in College accommodation screened this week.

The false positive rate for all pooled screening tests to date has been **1 in 373 (0.3%)**.

Summary for students living in College accommodation

Week	No. students screened	No. confirmed positive cases	Prevalence*
5th – 11th October	3,463	12	0.3%
12th – 18th October	3,675	34	0.9%
19th – 25th October	4,660	39	0.8%
26th Oct – 1st Nov	5,494	38	0.7%
2nd – 8th Nov	4,589	23	0.5%
9th – 15th Nov	5,339	80	1.5%

40 536 729

Sarah Murray @MrsSarahMurray · 5 Std.

Sorry, I'm confused. The report states that the false positive rate is 1 in 373 (0.3%). How does this fit with your tweet, please?

I've argued for weeks, possibly a small number of months, that prevalence is low and endemic (in which case, the concept of 'spreading' and 'measures' to prevent same is invalid) or, on occasion, actually zero. Neither justify continuing suppression of society. This is obvious.

"Dr June Raine, chief executive of the MHRA, which approved the Pfizer/BioNTech jab, said that similar reactions "were not a feature" of the vaccine trials."

They wouldn't be, as such individuals were excluded from the trials.
Did MHRA even read the protocol? Not convincing.

study participation or, in the investigator's judgment, make the participant inappropriate for the study.

- Phases 1 and 2 only: Known infection with human immunodeficiency virus (HIV), hepatitis C virus (HCV), or hepatitis B virus (HBV).
- History of severe adverse reaction associated with a vaccine and/or severe allergic reaction (eg, anaphylaxis) to any component of the study intervention(s).
- Receipt of medications intended to prevent COVID 19.
- Previous clinical (based on COVID-19 symptoms/signs alone, if a SARS-CoV-2 NAAT result was not available) or microbiological (based on COVID-19 symptoms/signs and a positive SARS-CoV-2 NAAT result) diagnosis of COVID 19

Ben McDonnell @jiver222 · 14 Min.
First, do we know if people that had adverse reaction had anaph shock or "just" a local reaction i.e.skin? I read that they had to use their adrenaline pumps, which implies shock. Which begs question why did they volunteer, or didn't they? I know NHS too well.

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

‘There’s no PEG in the vaccine’ followed by ‘The vaccine does contain PEG’. Confusing.

We've been asked to check a number of claims about the new Covid-19 vaccine and its ingredients.

Several websites have claimed the Pfizer vaccine contains "PEG" which could cause large numbers of allergic reactions, and also that the vaccine may cause infertility. The sites also claim any Covid-19 vaccine may make the disease worse, and that the studies are too short to check the vaccine is safe. There isn't proper evidence behind any of these claims.

"The mRNA vaccines from BioNTech/Pfizer

Menu

Dongle

It's true that the BioNTech/Pfizer vaccine does contain polyethylene glycol (PEG). This substance is used in some vaccines but is safe in these quantities. It's also safely used at higher concentrations as a laxative, and has a range of other uses from food to cosmetics.

It's true that in rare cases people can have allergic reactions to PEG, but these are usually to medications where the PEG is the main ingredient, for example in solutions to prepare for colonoscopies. In the vaccine, PEG is just an "excipient", so not an active ingredient that makes the vaccine work, but present in a small

Replying to @indymeansindy @ClareCraigPath @RoodGridance

There's no evidence that NPIs (non-pharmaceutical interventions) have any material impact on transmission.
'Lockdowns' and the like are not associated with reduced fatalities in dozens of studies.
Masks don't prevent transmission of respiratory viruses.
So, you're correct.

I assume Hospital admissions and 'cases' led gov to lockdown. It's hard to claim that there was nothing to worry about unless you can first prove that Lockdowns have no positive effect. Scrutinising the data gov use to justify lockdown is more compelling imo

1

Cb @Cb46675698 · 5 t
Today is the monthly hospital activity data release. It shows a range of data relating to hospital bed occupancy up to 3rd December. Guess what, Covid makes up very little of occupancy of general, acute or emergency beds. Every Trust listed and by region and UK.

Just before a big vote, SAGE warned that the NHS was about to be overwhelmed.
Also that ONS prevalence had climbed dramatically.
Now we see beds data. Nothing unusual.
ONS quietly restates numbers. No spike.
MPs: ever feel you've been misled?
We did brief you. We will again.

The false positive rate for all pooled screening tests to date has been 1 in 373 (0.3%).

Summary for students living in College accommodation

Week	No. students screened	No. confirmed positive cases	Prevalence*
5th – 11th October	3,463	12	0.3%
12th – 18th October	3,675	34	0.9%
19th – 25th October	4,660	39	0.8%
26th Oct – 1st Nov	5,494	38	0.7%
2nd – 8th Nov	4,583	23	0.5%
9th – 15th Nov	5,339	80	1.5%

100 1,2 Tsd. 1,7 Tsd.

Sarah Murray @MrsSarahMurray · 9. Dez.
Sorry, I'm confused. The report states that the false positive rate is 1 in 373 (0.3%). How does this fit with your tweet, please?

9 38

ella pemberton @ellapemberton · 9. Dez.
Think it's the results from the 6th December when they were retested they all came back as false positive ?

1 3

Sarah Murray @MrsSarahMurray · 9. Dez.
Yes, I get that, but how does this fit with the FRP of 0.3% actually quoted by the paper itself?

6 6

Phoenix44 @Phoenix4419 · 12 Std.
It's very simple. If nobody is actually infected then all (100%) of the positives were false. The FPR is then the percentage of positives that were recorded (0.3%). 100& of the 0.3% was false.

9 38

Old Normal #KBF @OldNormalLife · 9. Dez.
Because the positives (the 1 in 373) are 100% false

2 3

Tony @pheadtony · 15 Std.
That's not the FPR though is it? (as stated by the dodgy pcr claims account)

1 1

Old Normal #KBF @OldNormalLife · 13 Std.
People are generally confused that what seems like a low FPR rate can result in 100% of positives being false. This is one of the reasons why the #PCRTestPandemic is still being perpetrated.

2

Tony @pheadtony · 13 Std.
Having a handful of FPs out of 000s of tests does not indicate a problem. It is normal when screening populations. I know people are confused, but everyone has the responsibility to fact check their sources. @pcrclaims is spreading misinformation & I've reported the tweet.

2 1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @pheadtony @OldNormalLife und 4 weitere

Sorry, that's inaccurate. Whether a low FPR is a problem or not depends on prevalence. If FPR is a low sounding 0.3%, but prevalence is 0.1%, 75% of positives are false. You can't judge on FPR alone.

Thanks Tony. Well said.

1 1

Old Normal #KBF @OldNormalLife · 2 Std.
It's a massive issue. PCR test results are used to justify lockdowns and restrictions. If the % of positives that are false is >90% (which many examples have shown to be the case, like the Cambridge one), then this is only #PCRTestPandemic

1 1

Tony @pheadtony · 2 Std.
The rate of false pos is not different (probably better) than most screening tests for any disease or condition. The level of the FPR is known and predictable. Using this dataset to mislead people is dishonest.

1 1

Old Normal #KBF @OldNormalLife · 1 Std.
PCR is totally unsuitable when population infection rate is low

3 1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @OldNormalLife @pheadtony und 4 weitere

Exactly. Those commenting otherwise may mean well but they're wrong.
Prevalence is an essential & very important component of judging relevance of a FPR, even if latter is a low value.
FPR alone is NO guide to the false diagnosis rate, which was 100% in this case.

Kate Harvie @Roseberrykate · 11 Std.
It's not pro-lockdown to point out that the NHS has been chronically underfunded and run down for the last 10 years. It's not a simple binary.

1 1

Ruth Holliday #JoinAUnion @RuthHolliday1 · 11 Std.
Absolutely! If NHS was funded properly and test and trace was given to local authority and NHS instead of Tory cronies we would have had fewer cases and fewer deaths - like Germany - but when hospitals are overwhelmed what else can we do?

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @RuthHolliday1 @Roseberrykate und 2 weitere

The hospitals aren't overwhelmed. That's just incorrect. I do think there is a staffing crisis brought on by over testing staff with an error probe PCR mass testing system. They're forced to self isolate, prob inappropriately. ALL positives should be retested. We used to do this.

How many would you expect to die over 11months? Serious question as the staff population is very large. Wouldn't it be in the low thousands?

I suggest you reach up about Cargo Cults. I swear those favouring lockdowns & other lethal restrictions must have a semi religious zeal about them. The evidence is stark & clear. Just stop. This attitude is killing many people & destroying the lives of most others, mine included.

Second wave or #SecondaryRipple?
All real covid19 deaths in autumn or some false positive covid19 deaths?
Rational response from SAGE/Govt or deranged?
Happy to let this go on indefinitely or ready to take on responsibility ourselves?
Lockdowns do not save lives, but cost them.

86 784 2,1 Tsd.

How do you know I didn't?
At least their hearings are public. You should try listening to their advisory committee. Very strong debates. Unlike our behind the scenes process. Just embarrassed for MHRA.

AutPen 3.8 @ArtySmokesPS · 27 Min.

I'm sure the thousands of families of people that have died of Covid in the second wave will be greatly comforted by you referring to those deaths as a "ripple".
Downplaying the virus is what keeps it going indefinitely. You should be urging caution. The deaths are real.

1

Antwort an @ArtySmokesPS

As are all those dying on their thousands from non-covid19 causes. Estimate of over 200,000 deaths built in now. It's utter madness.

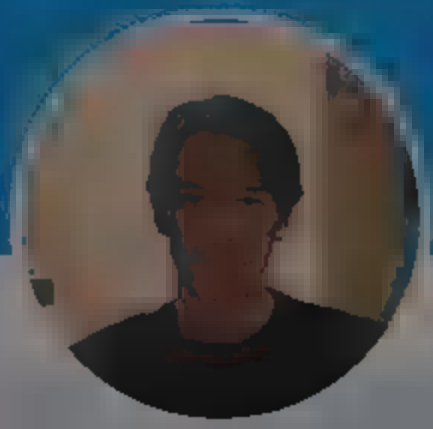
Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch



Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

These are "attributed" to Covid. That's the big hole in the theory. The challenge is out there and it hasn't been addressed.

Proof has not been provided. It is our place to believe. But we do not believe.

1 1

Neal O'Kelly @NealOKelly · 35 Min.
Sure, but Joel Smalley doesn't provide an alternative explanation. He just discounts 27% of all COVID deaths "because reasons".

And because his "data" shows what you want it to show, you just accept it without question.

That's an incorrect characterisation. First, he correct deaths for date of occurrence not registration. It's a surprisingly large effect and always flattens the most recent data. The rule defining Covid19 deaths mean many are misattributed. We not only know this by inspection...

...autumn in different areas compared with spring. Not only regionally such as the NW vs London, but right down to the granular level within the NW. It's remarkable. It fully marries up to the predictions in my "What SAGE got wrong" article. lockdownsceptics.org/what-sage-got-… Hope helpful.

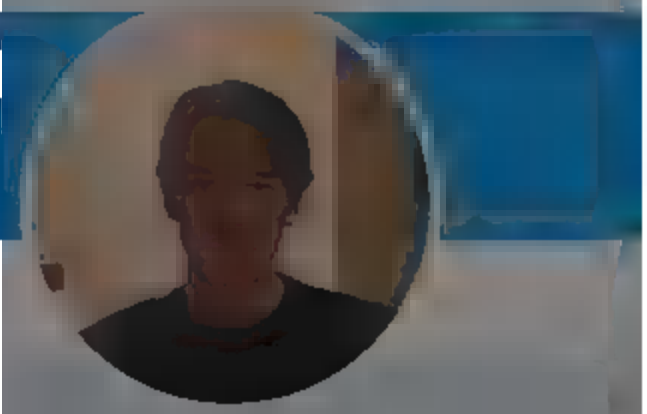
PCR false positive pseudo epidemics go back a long way. This is 1998-9.
The occurrence is old, but the recommendations could be applied immediately & life would be a great deal better.

this test, particularly if it is used exclusively for confirming the diagnosis. Based on the results of these investigations, the following standards should be followed by all laboratories performing PCR for *B. pertussis* DNA: (i) maintaining culture capabilities for *B. pertussis*, especially during times of suspected higher pertussis incidence so that the diagnosis can be confirmed for at least some cases, (ii) running one negative control through the entire processing step for every 7 samples, (iii) running small batches of samples (10 to 12 per run), (iv) performing proficiency testing regularly in a blind fashion to ensure proper test and personnel performance, and (v) incorporating hierarchical acceptance criteria monitoring for test failures, including positive and negative functional controls, reevaluating multiple consecutive positive specimens, and confirming that positive specimens were collected from persons meeting the pertussis clinical case definition.



Many of the confounding PCR diagnostic test results we experienced throughout these outbreaks reflect the current state of PCR technology in general and of pertussis diagnosis in particular. PCR for *B. pertussis* DNA assays evolved rapidly, and numerous protocols have been reported; because of the sensitive and timely results that they provide compared with the diagnostic standard (*B. pertussis* culture), these assays have moved from reference laboratories and academic institutions to smaller treatment facilities. Consequently, PCR testing may soon ascend from presumptive to diagnostic status and become the standard of care. However, no commercial product is avail-

Note recommendation (ii) 'run a negative control through the process every 7 samples'.

Also (iii) run samples in small batches of 10-12.

I'm concerned the Lighthouse Labs are incapable of doing what's claimed for them while consistently maintaining end to end sample integrity.

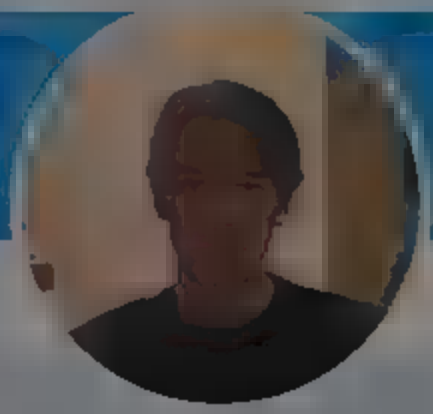
Antwort an @alexkx3 @bealelab



Exactly. This is the cause of my predicted #SecondaryRipple.
I don't believe it classifies as a "2nd wave" if for no other reason than that is but a few % of the magnitude of that predicted by SAGE.
It is absolutely not a public health crisis.
Nb: PCR test results are illness.

Is Immunity playing no part in London in helping keeping it suppressed?

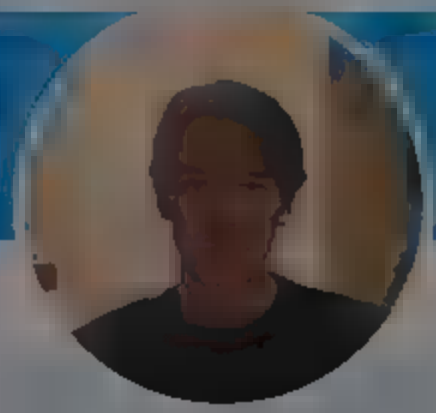
1

Rupert Beale @bealelab · 15 Std.
It will be playing exactly the role you'd expect with ≈10-15% immune. Not much, and certainly not enough.

3 9

Yardley Yeadon
@MichaelYeadon3

Folgen



Antwort an @bealelab @1nationtory

If that was extent of immunity, agreed. But it's not & yes it is protecting London (& almost if not all of U.K. now, the #SecondaryRipple having probably crested everywhere where it has appeared). In no location has covid19 reappeared. Always areas less affected than in spring.

Antwort an @thatsmanderley

Can anyone explain succinctly what is the rationale for this? If the aim is to understand infection & immunity in this demographic, the optimal method is proper sampling. It's neither necessary nor ethical to test everyone to obtain such information.

Quite. It's neither necessary nor ethical to perform mass testing in order to understand transitory infection levels. And as they are poor transmitters it's arguably unnecessary to even sample.
This is our money as well as our kids. Plots have been lost. Please stop.

Antwort an @pjhobday @thatsmanderley @mattletiss7

Since they're poor transmitters it's unhelpful info particularly as a positive test in no way equates with infectiousness.
To add insult to injury, the result in any case is like an MOT: at best, valid only on date of issue.
It's an utter waste of time & money and is an assault.

What has been the Austrian press response ?

What has been the Austrian Government's response ?

Are our lives being ruined with faulty data, testing and mistakes?

Anshul @Anshul__K

An Austrian MP uses a lateral flow test on a glass of coke and it comes back positive.

Show this thread

75 348 863

Roys35 @Roys351 · 18h

This is not the first case to make a point. Tanzania tested a piece of fruit and it came back positive

This is all part of a bigger agenda.

As docs/scientists been saying for mths proper cases need to be dealtbwith at a clinical level

That example was a PCR test.
I am not sure what's going on with LFT, but I suspect it's a silly stunt which reveals nothing at all about the ability of LFT to detect viral proteins. More likely a colour change from pigment or acidity change.

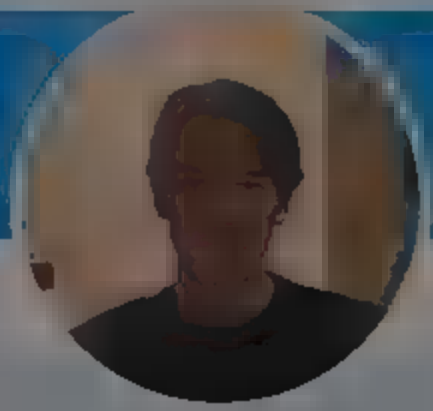
offshorebella @offshorebella · 18 Std.
How was he so sure it would come back positive?



1 1

TONY @TRIPLETTRADING · 18 Std.
A wild guess but i would say he has already tried the test.

1 10

offshorebella @offshorebella · 18 Std.
He opens a new test. They would all have to be faulty for him to be so sure it would come up positive. Is he saying that coke causes a false positive on all tests? (with no subtitles it is hard to know)

Please be aware that LFT operates on completely different technology from PCR. The end point in LFT is a colour change in an indicator panel. The change is driven by an immobilised enzyme & formation of a coloured product. Adding coke is likely to screw it all up. Meaningless.

Hancock is too stupid to blame. He cannot integrate what SAGE tells him.
I do blame SAGE. They know perfectly well that lockdowns do not prevent transmission & that they only cause harm.
Individually & collectively, I believe they've committed criminal acts. I would so testify.

This lethal farce has gone on far too long.
The pandemic is now PCR mass testing.
Remove questionable “cases” & we see that nothing much unusual is going on.
Shut down the Lighthouse Labs & recover normality.
Boris: if you’re constitutionally unable to order that, fire SAGE.

It's a massive fraud. The PCR tests can pick up anything. Unless tests are stopped we will be in a constant merry go round of positive tests and dying from positive test.
The guy who invented the test even said it shouldn't be used for diagnostic purposes!

I think this is an excellent idea, Sir Desmond! He's clearly an intelligent man & will be able to detect when the explanation offered clearly doesn't "adjust for false positives". Not possible since they don't know the FPR. PCR test should be discontinued as its uninterpretable.

I urge all followers who have read my criticisms of PCR mass testing in U.K. to carefully read Mr Fordham's carefully worded letter. Note that the innovation minister in the Lords, Lord Bethel, already admitted that the PCR system doesn't have the equivalent of an MOT.

Without this information it's impossible to interpret any result. If the oFPR is 4%, for example, and if the true prevalence is 0.3% (it's probably less), then for every 10,000 tests, 400 positives would be false & 30 positives would be genuine. So 93% of positives are false.

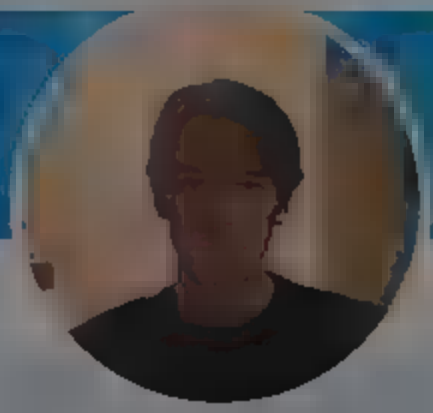
R-rate rises across UK & Sage warns it could be >1 in London

Hands up those who've high confidence that "cases", usually unconnected to respiratory symptoms, are a reliable guide to the status of SARS-COV-2 in the capital?



If you put your hand up....why?

Coronavirus news live: Latest updates as UK faces Christmas 'disaster' | The Independent

I regret to say there are but two options to explain why they'd say this: 1) sheer incompetence, 2) lying.

Neither commend the advisors as suited to their roles.

Here's a test comparing PCR with LFT. You'll see a claim that LFT "only finds half the cases". A fairer interpretation is that "PCR declares positive many samples containing too little virus, and perhaps virus fragments, which are from non-infected & non-infectious people".

Jonathan Engler @jengleruk · 5 Std.
Agreed, but it stops the more independently-minded ones, including for example smaller radio stations. OFCOM regulates all broadcast media in the UK - not just the big boys.

2 1 15

scott @scotty459 · 4 Std.
Well how do stations like talk radio manage to broadcast questioning the validity of restrictions and pcr testing then?

If they can why can't itv or bbc?

1 1

Jonathan Engler @jengleruk · 4 Std.
They've taken a flyer on interpretation of the guidelines and hats off to them for courage.

The others: pathetic mouthpieces for government propaganda.

1 1 5

scott @scotty459 · 4 Std.
But the fact they have managed to do it should show others they can also.

If the others choose not to then it proves they are part of the problem

2

Antwort an @scotty459 @jengleruk @NickHudsonCT

I think there's a judgment OFCOM makes, not only what's being said, but it's reach. So they largely tolerate talkRADIO.

They haven't been shouting about contamination from what I've seen. They've been saying the tests aren't accurate because they pick up other viruses. The article actually confirms the test itself is very accurate and doesn't do this. Lab contamination can be addressed as needed

Incorrect: lockdownsceptics.org/the-pcr-false- …

I once mentioned off target as a possibility but have relentlessly focused on cross contamination. As here, in excruciating detail. Interested in your comments, as you'd clearly not seen it (or you wouldn't have made that comment).

Let's be clear. Government does not know the operational false positive rate for PCR mass testing. This is akin to driving a vehicle without an MOT. Might be OK, but it's improper at best & may be lethal.

Iain King @lainbking · 8 Std.

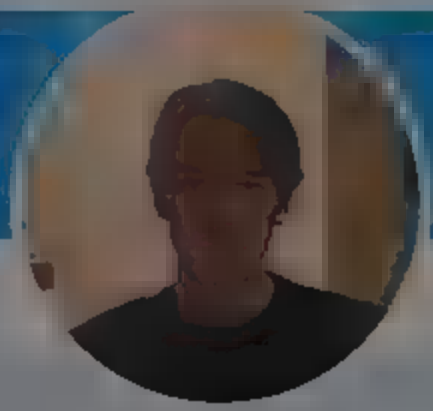
We've lost more lives to COVID in the first ten days of this month (c 4100 COVID deaths) than in the whole of three decades of Troubles in Northern Ireland (c 3550 deaths). 'COVID pandemic is no more', 'No risk to society' - really?

11 2

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @lainbking @JeffreyPeel @ClareCraigPath



No. You've assumed the label 'covid19 death' is completely correct. It's not. There's a lot of misattribution. The inaccuracy in PCR mass testing is now so extreme that it must now be an act of will to pretend to trust its results.

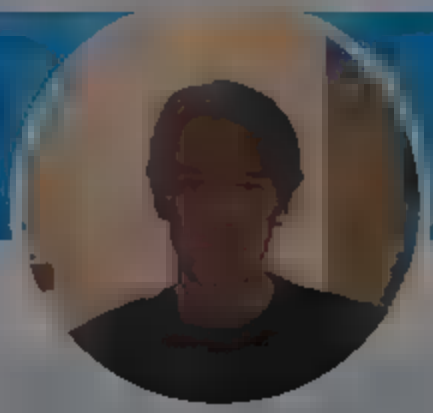
A quick question Dr. Craig. Are antigen tests the way forward as I believe they are cheap, quick an accurate?

1 2

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @icnoble @JeffreyPeel @ClareCraigPath



I believe Clare & I both believe mass testing is simply unnecessary. If pressed we'd pick LFT. Wherever it's been used, the results show either low & potentially endemic levels of virus or none at all. Liverpool, Merthyr, Medway, plus several Austrian cities including Vienna.

This is great. The first time the notion of "asymptomatic transmission" was mentioned, I smelled a rat. It's biologically implausible. Not saying it's never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

ARTICLE

https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

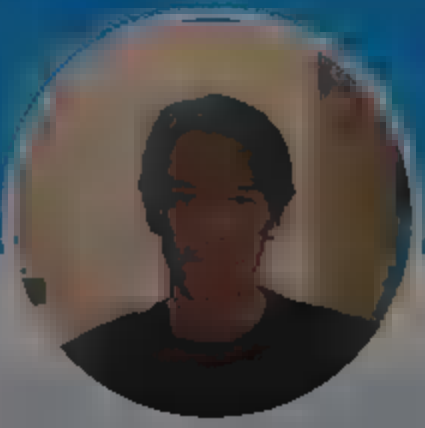
Covid: Relaxing restrictions 'could trigger third wave', NHS bosses warn - BBC News



Even SAGE have been wrong about everything despite doing all they could with rotten PCR mass testing to help elevate “cases”. Now we’re asked to believe NHS bosses?

This is great. The first time the notion of “asymptomatic transmission” was mentioned, I smelled a rat. It’s biologically implausible. Not saying it’s never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

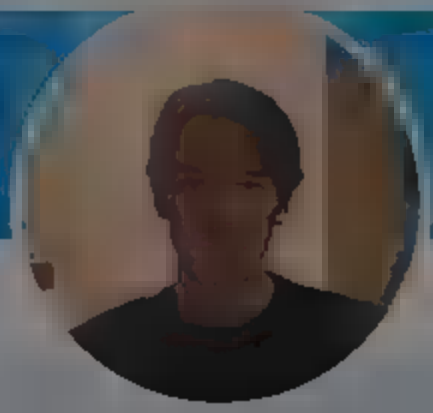
https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch



Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

underfoot.
As the MP says so well, this is all for a virus of not particularly remarkable lethality, with median age at death being slightly older at 82.7y than is normal life expectancy for that cohort.

What a good speech this is. He expresses so clearly what is motivating me & driving my emotions & actions. What is happening has no longer anything to do with a virus, or with protecting anyone. To pretend it is, is either wilful blindness or complacency beyond measure.

Anyone unsure what's the extent of excess deaths in autumn/winter arising from SARS-CoV-2 should read this by Jonathan Engler. Spoiler: there aren't any.
Surely that's impossible if we're on the midst of a 2nd wave of a respiratory virus pandemic?
Quite. You're being lied to.

kronosneo @kronosneo1 · 8 Std.
Hi, interesting also is the fact that the antibody testing is flatlining. Pretty obvious indicator that pandemic is not as portrayed.

1 5

Marty @martytwit · 6 Std.
antibodies will fade naturally. If you had antibodies for everything from which your immune system protects you, there would be no room for anything else. T-cell magic enters the room.

1 2

kronosneo @kronosneo1 · 5 Std.
Hi, i am talking about the survey which in ongoing. See gov daily data. If there was a raging pandemic it would show up in increased antibody levels as it was at the beginning of the year.

2 3

Antwort an @kronosneo1 @martytwit @jengleruk

Yes. I think you & Marty are saying the same thing.
I recall the astonishing misinterpretation by BBC & others panicking that “antibodies are falling, and with it, immunity!”.
Couldn’t believe it. What falling Abs show is virus isn’t circulating at elevated levels. No question.

Govt is meant to do what it can to protect you. This evidence is not consistent with discharge of that duty.

Jonathan Engler @jengleruk
And that is what we do in fact see. ~29k of the ~60k excess deaths seen in 2020 to date were at home, and 90% of these were non-Covid.

Attitudes like that may destroy the country & with it, our secret weapon: our sovereign currency.
We already cannot borrow conventionally & have resorted to 'monetary financing': the Bank of England prints money & gives it to Govt in exchange for an IOU. Markets take dim view.

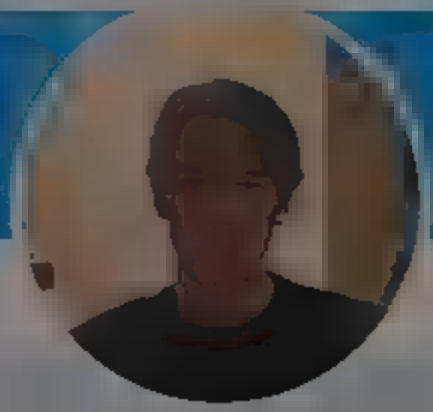
oldbexleyboy @Oldbexleyboy · 14 Std.

Doesn't LFT pick up cases more likely to be infectious because of high viral load ?

1

Yardley Yeadon
@MichaelYeadon3

Folgen



Antwort an @Oldbexleyboy @Queenzooch und 3 weitere

Yes. It's simply incorrect to say "LFT misses cases" unless as they do you define PCR as 'gold standard' & demand any alternative test also over amplify & show positive to clinically irrelevant amounts of virus.
In brief, it's non scientific propaganda.

I believe Clare & I both believe mass testing is simply unnecessary. If pressed we'd pick LFT. Wherever it's been used, the results show either low & potentially endemic levels of virus or none at all. Liverpool, Merthyr, Medway, plus several Austrian cities including Vienna.

2 29 159

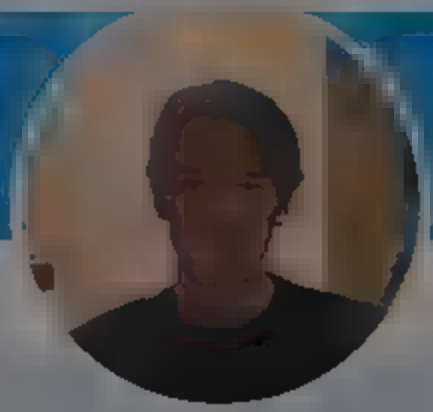
oldbexleyboy @Oldbexleyboy · 14 Std.
Am I right in thinking LFT picks up infectious cases because of high viral load ? And misses 'asymptomatics' with low viral load ? In which case shouldn't we replace the PCR with LFT for those reasons alone in surveillance to reduce risk of further outbreaks ?

1 4

Danielle Abittan @daniabittan · 13 Std.
Absolutely not. It is well documented that undetectable = untransmittable. There's no such thing as being a "secret carrier".

2 2 8

Yardley Yeadon
@MichaelYeadon3
Folgen



Antwort an @daniabittan @Oldbexleyboy und 3 weitere

Agreed. At least, it's certainly true that asymptomatic transmission is a very minor contribution to an outbreak. What's much worse, when prevalence is low, is to unleash a test like our PCR mass testing system which definitely "overreads".

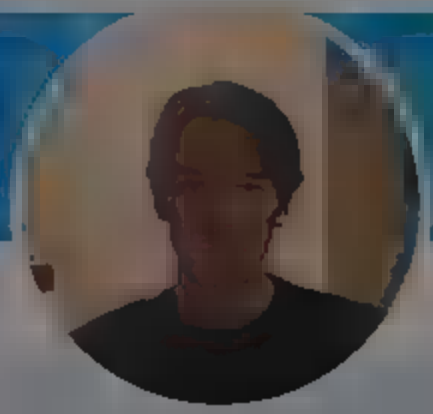
Interesting but why have you used 1999/2000 data and 'adjusted' for population (whatever that means)? Surely better comparison would be 5 year average?

3 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @44tunafish @BruceFutur1 @JamesMelville



Population changes the base deaths expected.
More important the number of deaths is rising fast because we have so many more elderly people even than 5y ago.
Demographic time bomb of which I'm a later member means 'normal' death rate has to be increased vs 5y average to be right.

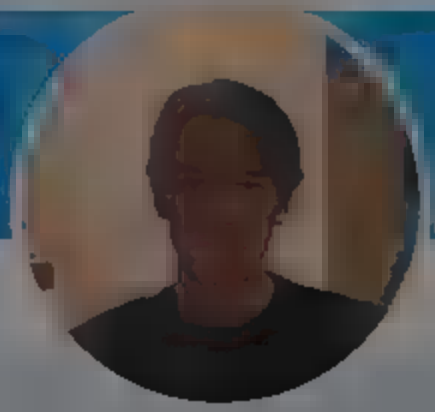
Ronan Hayes @hayesronan · 4 Std.
Slightly disingenuous to not wait until end of 2020 to compare. Assume December is typically a slightly higher than average month (given the season), reasonable to assume this will be 95k+ by EoY. Which would be 4.8% higher number of deaths than previous 9 yr average

4 11

Yardley Yeadon
@MichaelYeadon3
Folgen



Antwort an @hayesronan @JamesMelville

Even if true, so what? In some years, respiratory viruses do lead to higher total deaths than in others.
I think the point being made, in my view successfully, is that there isn't a huge signal, warranting draconian measures.
If that's the counter argument, I'm not seeing it.

Lars Svendsen @NorsemanAnon · 2 Std.

Even included an averaged month of December, even though it looks a tad bigger than the foregoing years, it's really nothing.

The Swedish population is growing older. And it's this fact that accounts for the little increase in the crude death statistics.

1 2

Alex! #Norfolk #Suffolk border @Alex_on_A14 · 1 Std.

Ive seen a graph of increasing life expectancy since WW2. gradual increase like a rule. One year different. You guessed it.

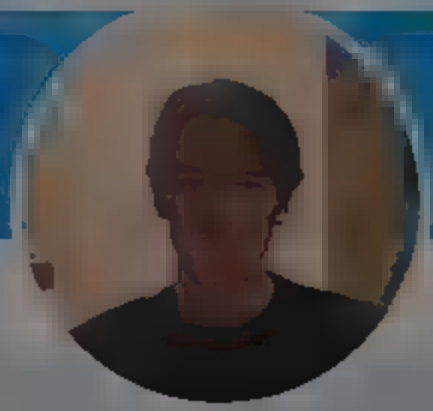
I agree SE vulnerable due to unique longevity but also less vulnerable due to other factors.

But here its 11 months against 12.

1 1

Yardley Yeadon
@MichaelYeadon3

Folgen



Antwort an @Alex_on_A14 @NorsemanAnon und 2 weitere

No, death rate is increasing in recent years. This because of prior success, paradoxically. The population is older because early age deaths reduced. Eventually, such a population approaches practical limit age & death rate inches upwards, just reality. Why using 5y av misleads.

Can I please ask why people are not taking a huge nationwide civil action to ban masks. Seems every other thing about lock down measures has had or in the process of court action.
But I've not seen the unmasking court action.

I've been out of the country for 6 weeks. During that time, the bits of England I'm seeing are more dense with masks, all over the street & while driving. I wouldn't be surprised if people had sex wearing them. Full on bonkers & no new laws required. There's your answer. Sadly.

lockdownsceptics.org/the-strange-st …

I'd never heard of 'number theatre' but it describes the way in which we can so easily be fooled by stats.

The 3,040 deaths attributed to COVID-19 by the ONS can be reduced immediately to 1,311. This is achieved by taking the 12,456 recorded deaths for Week 48 and subtracting the deaths we might have expected that week anyway, based on the last 10 years and the mean increase as weighted against a rising population. Since that figure, 11,145 deaths, does not take into account 2020's elevated increase in deaths from suicide, untreated conditions and so on we could theoretically reduce the 1,311 further by assuming at least some of those additional deaths are attributable to non-Covid factors. Deductions could also be made for those whose deaths have been attributed to Covid when in fact they died from something else and/or thanks to false positives (although, to be fair, we may have already

assessing the true impact of unusual conditions, since it is as absurd as assuming any given week in a year is exempt from ever experiencing extreme weather that bucks the trend.

The first two months of 2018 showed a dramatic increase in overall deaths on a weekly basis, attributable to a flu epidemic, and an ageing and growing population. The overall and excess figures matched or exceeded those that have been made so much of for October and November this year including Week 48. They were also worse than previous January and February of recent years but existed no comment at all at the time – or Government intervention. If we really are in the midst of a major epidemic now, why weren't we in one in early 2018?

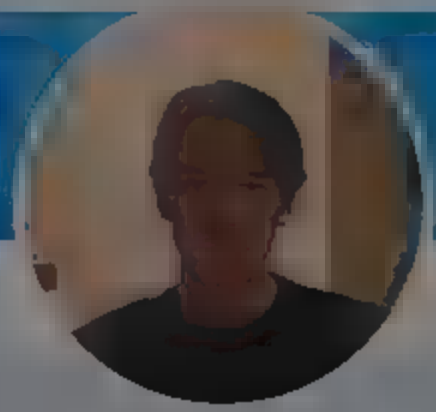
I've argued repeatedly that PCR mass testing produces more "cases" & ultimately "covid19 deaths" than are really happening. If that's correct then the stated weekly Covid-19 death toll ought not to be 'on top of' the deaths in a given week from all other causes. And they're not.



1

What is the reason given? A very seriously injured patient isn't on an open ward. She's unlikely to give him covid19 (though in any previous year any visitor might have given him 'flu). She can't infect others as she won't be near them. Cruel, hateful, thoughtless policies.

And what is the source of all this pain??

The #PCRtest. Churning out bad data obscuring the true picture, creating a misplaced sense of danger and risk, causing extensive misdiagnosis of patients who probably have other respiratory conditions, & justifying lockdown.

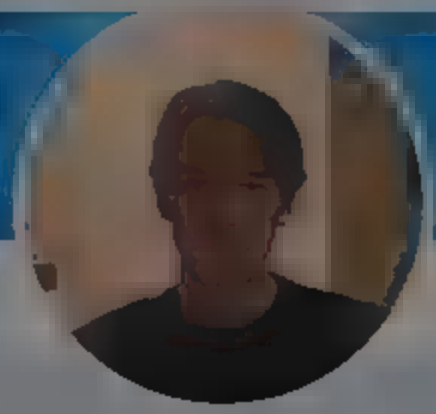
https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch



Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

Antwort an @alanmcn1 @ClareCraigPath

Why bother? Because Pillar 2 testing yields results which are clearly wrong.
Eg. positivity in Bolton was recently reported as over 20%. This is implausible.
I discussed it with one of U.K.'s more famous immunologists. They chuckled.
So junk is the output. I don't trust it.

Note that Alan hasn't answered Mike's question. So, Alan, how do you run your negative controls?

2 12

Yardley Yeadon @MichaelYeadon3 · 4 Min.
Based on evidence from a highly experienced expert in this very technique I'm sure that (1) no process-related virus-free 'negative controls' are run (in MK Lighthouse Lab) & (2) a plate control in PCR purports to be the whole process negative control. That's a deception.

2

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @MichaelYeadon3 @ninekeanes und 2 weitere

What should happen & was done in any testing I ever did where there are several steps is to put in negative controls together with samples.

I'd also insert separate negative controls in another step in the overall process, so if there's an issue, I know where it occurred.

24% of staff having been infected still positive 6w later. This sample is concentrated on those recently infected. Yet >20% of those in Boston were positive at one point. The general population. Some will have had covid19 but not all. I don't believe the 20%. It's grossly wrong.

time again.

We cannot say for certain what proportion of the results are affected. Last Friday, however, an academic journal reported that almost a quarter (24 per cent) of infected staff and patients at the John Radcliffe Hospital in Oxford were still testing positive for Covid-19 a full six weeks after the start of an illness that normally runs its course within 14 days.

If that were in any way representative, I'd have to conclude that the official coronavirus figures have been grossly overstated, with all the damage that entails.

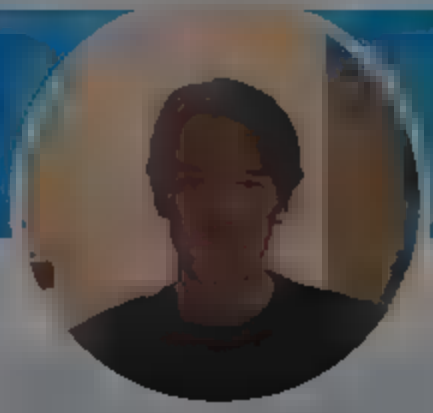
Antwort an @City1771 @alanmcn1 und 2 weitere

I've never said 'they're all false positives'. If you understood how cross contamination can occur, you'd realise the extent of it will vary. So, no: looking at one short time period won't dismiss this serious concern of which I'm secure in my evidence.



09:29 - 16. Dez. 2020

Dr. Bendor Grosvenor @arthistorynews · 8 Min.

Antwort an @MichaelYeadon3 @City1771 und 2 weitere

This is not about short time periods. This is about you going from 'it's a medical fraud' on the basis of your false positive theory, to being able to explain why PCR tests don't show a consistent FPR in 1) people who have had the vaccine 2) the weeks after lockdown measures.

The original large RCT, largest prior to Danmask. Shows no protection against respiratory viruses either.
So why 'face coverings' are legally required is a mystery. This evidence is almost the first hit you find, so SAGE knows it.

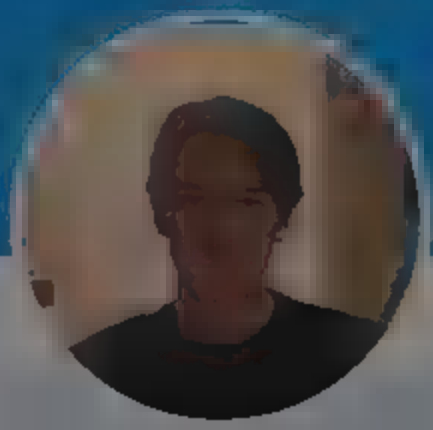
Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch



Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

cover up. How do you run your negative controls?

16 56 192

Alan McNally @alanmcn1 · 13h
That is complete and utter babbling nonsense. There are by definition virus free samples in every PCR run. Otherwise every sample would test positive.....

12 2 57

Angus Knight @AngusKnight1 · 12h
The question I think intended is "Are there dummy samples run through the whole process as to act as negative contamination controls?" Just adding a negative control to the assay plate is insufficient. We need transparency in SOPs and QA data to have confidence in the data.

2 4

Angus Knight @AngusKnight1 · 6h
Having read Alan McNally Nature pub it seems that MS2 is used as a positive control. However it is still difficult to control for cross sample and cross plate contamination and thats why external QA is so important.

Replying to @AngusKnight1 @alanmcn1 @ClareCraigPath

That's my question, yes, which you've more elegantly expressed. Surely negative controls, dummy swab tubes specifically, so the workers don't recognise them, are minimally needed? I am interested in the results from these negative controls through the entire process, routinely.

Tests for virus protein antigen (lateral flow). Though there is propaganda directed against it, it has at least been properly characterised (unlike PCR mass testing). Adequate sensitivity, cheaper & no black box.
Mass testing is superfluous as asymptomatic transmission is BS.

mortality by the end of the pandemic.

3 2 18

Rupert Beale @bealelab · 12. Aug.

The difficulty is twofold: firstly it's not implementable. Secondly it definitely wouldn't minimise death or economic damage. It's better to try to implement implementable strategies. I've advocated a South Korean type response from the start, it's certainly doing better than UK.

6 6

Martin Kulldorff @MartinKulldorff · 12. Aug.

Thanks for responding Rupert. Except for nursing home failures in Stockholm, Sweden has implemented said strategy. While lookdowns can lead to fewer deaths in the short term, it is mortality by the end of the pandemic that matters. South Korea has much further left to travel.

3 2 19

Rupert Beale @bealelab · 12. Aug.

Well... except for all that. And it's a curious business: officially the Swedish policy isn't 'herd immunity'. They're also nowhere near it, below 10%. Expect a further wave in the winter.

A person asserts that a country is 'far from herd immunity' based on how many people have antibodies to the virus. As virus prevalence falls away, so do antibodies. T memory remains, thus seroprevalence is no reliable guide to % infected (as Vallance dishonestly implied).

Unfortunately you are peddling the government line, that there were excessive deaths in March/April they simply changed the way they counted from recording actual deaths to registering deaths over a longer time frame. False from start to finish.

2 1

Yardley Yeadon @MichaelYeadon3 · 17. jouluk.
Angela,
That's an interesting idea but consider the number of deaths records they'd have to hide / store up in order to release them later?
Also, synchronising with simpler releases to EuroMOMO would get messy. Why do you say what you do?

1 5

Doug_Hunter @DougHun73315248 · 22 t
I think it's a reference to deaths from covid then attributed by Public Health England outside of 28 days even it was from another cause, a correction to this was won by Professor Heneghan so that covid could only be attributed to cause of death within 28 days of a positive test.

Antwort an @gasdoc1982 @sarahbear3333 und 3 weitere

It's simply not necessary to replace it. We've never in history gone about testing asymptomatic people. I know tier 2 is supposed to be symptomatic but it's very common to be told to go & get a test.
The notion that asymptomatic transmission is important is incorrect & a deceit.

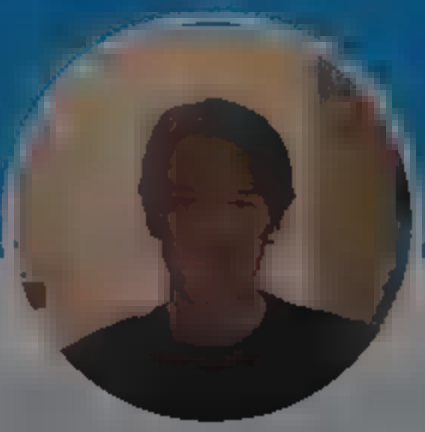
And with the mass testing in schools due to start the 'cases' are going to shoot up again in the new year. It's lunacy.

1 5

Yardley Yeadon
@MichaelYeadon3



Folgen

Antwort an @sarahbear3333 @deb_cohen und 2 weitere

I'm afraid it's certain. I have no idea why this is being done. The results at best are correct only on the day the test is done. If prevalence is sought, carefully designed sampling is a far superior method than mass testing. It could also be done repeatedly for same cost.

Where's your evidence? I see you posting lots of wild unsubstantiated claims but no actual data to support any of it.

There are, however, plenty of data and studies showing specificity to be 99.9%+, including at MK when it was reported to HSE.

John Bye @_johnbye
Some people still seem convinced the recent surge in covid-19 cases is caused by "false positives" (people who don't have the virus but still test positive due to various issues), often claiming 90% of reported...

...controls, virus-free swabs specifically, through the entire process. So any cross contamination is being missed.
I'm aware there are negative plate controls in PCR. These do NOT address the issue.
No point in shelling me with misleading & irrelevant info, thanks

You could adopt a more conservative position & say that, of the original 31 positives which were retested, 100% turned out to be false, for a FDR of 61%.

Note that if you don't retest, you never learn which of the positives are genuine & which are false.

And we rarely retest.

This is why it is ESSENTIAL to know, routinely, in each of the small handful of large labs running U.K.'s PCR mass testing program, what the operational FPR is.

This value meshes with prevalence to yield the false diagnosis rate.

It's fraudulent to pretend that the FPR is zero.

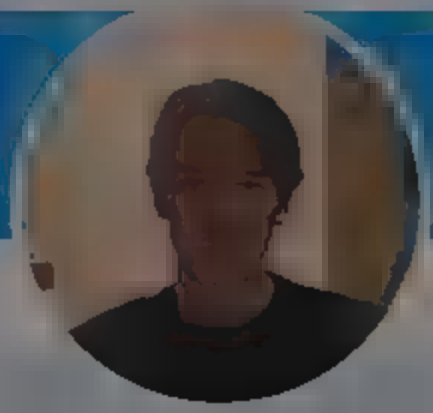
Note how very low transmission is reported to be from people without symptoms. The only people surprised by this are those who believed the fibs about asymptomatic transmission in the first place. If you thought it was made up, kudos. You were correct.



Results A total of 54 relevant studies with 77 758 participants reporting household secondary transmission were identified. Estimated household secondary attack rate was 16.6% (95% CI, 14.0%-19.3%), higher than secondary attack rates for SARS-CoV (7.5%; 95% CI, 4.8%-10.7%) and MERS-CoV (4.7%; 95% CI, 0.9%-10.7%). Household secondary attack rates were increased from symptomatic index cases (18.0%; 95%

If it's true that it possesses increased transmitability this is the other side of the coin from virulence so we reach equilibrium faster.

This is one of 10,000 variants & nothing special. It's usual to see emergence / temporary dominance as virus replication is error prone.

the following applies:

- you have a high temperature
- you have a new, continuous cough
- you've lost your sense of smell or taste or it's changed
- you've been asked to get a test by a local council
- you're taking part in a government pilot project
- you've been asked to get a test to confirm a positive result

You can also get a test for someone you live with if they have symptoms.

3

Yardley Yeadon
@MichaelYeadon3

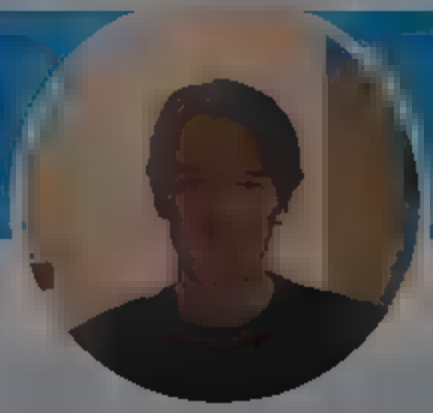
Antwort an @M0kujin @profnfenton



You don't need to actually have symptoms. Saying you have is enough. Often people are required to get tested, so they do whatever is needed to get one.
I genuinely can't believe this has to be explained to you.

I'm echoing Lord Jonathan Sumption.
These measures:
-won't save a single life
-will throttle the life out of any business on the edge
-will increase illness & deaths
-acceptance marks the end of democracy.
These people have no right to decide our choices.

Ian Cornwell @IanCornwell6 · 4 uur

Evidence is the growth in the proportion of the new variant, with regards to the old one.

It is crowding out the old version, therefore it spreads much more easily. Seen it myself at my sons' school. Old virus tended not to be spread by asymptomatic kids. This one is. Easily.

Sorry: I meant the concern is 'got up' (invented).
I know about the existence of tens of thousands of variants, the public databases being very good in this regard.
My favourite is NextStrain, though I confess I need help in visualisations from it.
Fortunately I have that help.

Indeed, the study has been done.
If PCR with 1 gene is run to high cycle thresholds, those with real virus at sub clinical levels will be tagged ‘cases’, even though there’s too little virus to make them ill or infectious.
No info on cycle threshold is made available with results

This is odd, because the vast majority are at less risk from this virus than from flu. Forcing vaccination on that majority is illegal & unnecessary for the health of anyone.

BernieʼsTweets @berniespofforth
I did tell you in April, May, June ...
And in November it was denied by this Government , even whilst they put it out to tender....

When we have a leader, this will be the list of demands that he embraces:

1. No more lockdowns
2. No mask nor vaccine mandates

If these are violated, the following will be implemented:

1. Boycott of Amazon
2. Occupation of government facilities

I don't know who is really governing the country but whoever it is, they've failed to consider the negative impact of 'measures'. Politicians would so consider. I'm led to the conclusion Boris is in no way in charge, which is pretty awful in what's notionally a democracy.

Post-lockdown SARS-CoV-2 nucleic acid scre
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

All I ask is that people be courageous enough to open their eyes, use brains & join some dots.
If there are aspects of this that bother you, scratch that itch. There are always loose threads, that's fine. But whole narratives? Spot one & you're over the line, never returning.

> **Jeffrey Peel** @JeffreyPeel
> As I was "de-platformed" by @williamcrawley on Friday I thought I'd write this piece to make some of the points I wanted to (but wasn't allowed). Lockdowns don't work. PCR tests are duff. And asymptomatic spread is misinformation.

It's good to talk, Mr Hancock.
I'm not alone in distrusting the results of testing.
Yet our entire way of life is beholden to these testing factories, which aren't being inspected by anyone.
Large amounts of money involved in testing.
Needs independent checking.

Pattern is what you'd expect if the virus had killed just a few in the recent weeks but what was rising steadily was the non covid19 deaths secondary to the 'measures'.
The pattern of recent deaths does not match those of an epidemic.
I'm content that's a correct interpretation.

Depends if you think NPIs work. If you think they do (I do), then it's an indication that the virus has been suppressed and excess deaths are significant but not like Spring. So it could be much worse if allowed to spread unchecked.

3

Yardley Yeadon
@MichaelYeadon3

Antwort an @DomOfClarkes @DocDM4 und 2 weitere

Fair enough. I think the evidence from multiple studies around the world do not show a negative correlation of NPI with deaths
That's a serious problem because there are obvious severe negative effects which may be permanent & much greater than the deaths it's claimed they save.

Good spot Dr Clare Craig on a trove of data released on Spain.

Looks like much of what's assumed to be & labelled as covid19 simply isn't.

Where have we heard that before?

Viruses don't do great big 2nd waves. #SecondaryRipple is all.

You don't smash an economy for that.

> **Dr Clare Craig** @ClareCraigPath
> Spanish antibody testing has failed to confirm COVID in 87% of their hospitalised patients and even 53% of their ICU COVID patients. Looks like Spain is in a false positive pseudo-epidemic. twitter.com/plaforscience/…

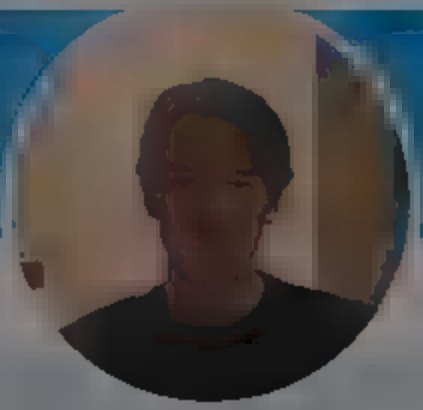
MKM @mamasaurusMeg · 52 Min.
Can we please talk about asymp/presymp positivity due to contaminated materials and site environ due to PPE misapplications? None of the masks used filter exhale of Covid particles and make airborne contagion spread worse.

1 2 6

Ryan Kemper @RyanKemper10 · 41 Min.
We need high quality studies that rely on laboratory-confirmed SARS-CoV-2 infection for this reason. If you can't culture it, it's not a real infection.

The other big mistake we make is not realizing that the presence of a virus doesn't indicate pathology.

2 4



Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @RyanKemper10 @mamasaurusMeg @ClareCraigPath

Agreed. Was shown early that single gene, high cycle threshold positives by PCR are NOT 'real infections' because it wasn't possible to infect suitable cells with virus from clinical samples.
Did we tighten up SOPs? Limit Ct? Associate Ct with all results? Retest weak positives?

That however is entirely normal & has happened six times this year already in Norway, for example.
Emergence & temporary dominance is how viruses become endemic & we happily coexist. No evidence exists that this is any kind of threat whatsoever. Wassocks

16 96 619

Ian Cornwell @IanCornwell6 · 20. Dez.

It doesn't seem to be any more of a threat. This "Wassock" just has a "cold" to show for it fortunately.

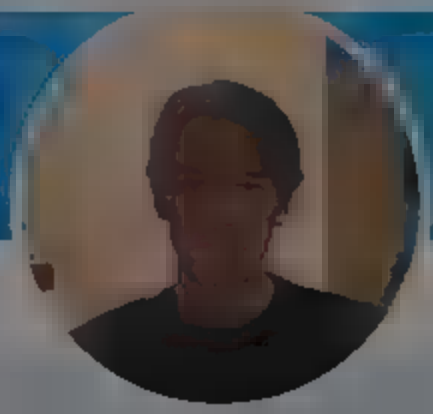
But asymptomatic schoolchildren can pass it on, whatever variant it is.

So that's important to know, if you have elderly relatives.

12 5

Yardley Yeadon
@MichaelYeadon3

Folgen



Antwort an @IanCornwell6 @carlheneghan

You're wrong about asymptomatic transmission. It's not a thing.
There's nothing special about this virus & previously no one rates AT as a thing. But without it there's no rationale for mass testing, masking or self isolation.
Requires a high burden of evidence, which is absent.

This data is inconsistent with a severe acute respiratory virus stalking the land, isn't it?
If there was one, a #SecondaryRipple has long passed.
It's time to stop complying with damaging 'rules' serving no medical purpose.
As Govt has gone full 'post science', show everyone.

Yes, I saw the absurd positivities from recent PCR mass testing, well up in the high-teens %.
Embarrassing. These values are literally unbelievable. If they were real, we'd be at herd immunity Tuesday week, latest. Thats if we weren't already.
It's utter contempt I find worst.

Not sure what's happened at WHO but I strongly recommend you don't let any A-level biology students see this lot of chuff. It's factually wrong in numerous ways.

'Herd immunity', also known as 'population immunity', is a concept used for vaccination, in which a population can be protected from a certain virus if a threshold of vaccination is reached.

Herd immunity is achieved by protecting people from a virus, not by exposing them to it.

Vaccines train our immune systems to create proteins that fight disease, known as 'antibodies', just as would happen when we are exposed to a disease but – crucially – vaccines work without making us sick. Vaccinated people are protected from getting the disease in question and passing it on, breaking any chains of transmission. *Visit our webpage on COVID-19 and vaccines for more detail.*

With herd immunity, the vast majority of a population are vaccinated, lowering the overall amount of virus able to spread in the whole population. As a result, not every single person needs to be vaccinated to be protected, which helps ensure vulnerable groups who cannot get vaccinated are kept safe.

The percentage of people who need to have antibodies in order to achieve herd immunity against a particular disease varies with each disease. For example, herd immunity against measles requires about 95% of a population to be vaccinated. The remaining 5% will be protected by the fact that measles will not spread among those who are vaccinated. For polio, the threshold is about 80%.

Achieving herd immunity with safe and effective vaccines makes diseases rarer and saves lives.

Find out more about the science behind herd immunity by watching or reading this interview *with WHO's Chief Scientist, Dr Soumya Swaminathan.*

What is WHO's position on 'herd immunity' as a way of fighting COVID-19?

antibodies, just as would happen when we are exposed to a disease but – crucially – vaccines work without making us sick. Vaccinated people are protected from getting the disease in question and passing it on, breaking any chains of transmission. Visit our webpage on COVID-19 and vaccines for more detail.

With herd immunity, the vast majority of a population are vaccinated, lowering the overall amount of virus able to spread in the whole population. As a result, not every single person needs to be vaccinated to be protected, which helps ensure vulnerable groups who cannot get vaccinated are kept safe

The percentage of people who need to have antibodies in order to achieve herd immunity against a particular disease varies with each disease. For example, herd immunity against measles requires about 95% of a population to be vaccinated. The remaining 5% will be protected by the fact that measles will not spread among those who are vaccinated. For polio, the threshold is about 80%.

Achieving herd immunity with safe and effective vaccines makes diseases rarer and saves lives.

Find out more about the science behind herd immunity by watching or reading this interview with WHO's Chief Scientist, Dr Soumya Swaminathan.

What is WHO's position on 'herd immunity' as a way of fighting COVID-19?

BSc biochem tox, PhD respiratory pharmacol. 32y new meds research. Left Pfizer 2011 as VP Respiratory. 2012 founded biotech Ziarco, sold to Novartis 2017.

Rural east Kent
Beigetreten Oktober 2018

which a population can be protected from a certain virus if a threshold of vaccination is reached.

Herd immunity is achieved by protecting people from a virus, not by exposing them to it.

Vaccines train our immune systems to create proteins that fight disease, known as 'antibodies', just as would happen when we are exposed to a disease but – crucially – vaccines work without making us sick. Vaccinated people are protected from getting the disease in question and passing it on, breaking any chains of transmission. *Visit our webpage on COVID-19 and vaccines for more detail.*

With herd immunity, the vast majority of a population are vaccinated, lowering the overall amount of virus able to spread in the whole population. As a result, not every single person needs to be vaccinated to be protected, which helps ensure vulnerable groups who cannot get vaccinated are kept safe

The percentage of people who need to have antibodies in order to achieve herd immunity against a particular disease varies with each disease. For example, herd immunity against measles requires about 95% of a population to be vaccinated. The remaining 5% will be protected by the fact that measles will not spread among those who are vaccinated. For polio, the threshold is about 80%.

Achieving herd immunity with safe and effective vaccines makes diseases rarer and saves lives.

Find out more about the science behind herd immunity by watching or reading this interview with WHO's Chief Scientist, Dr Soumya Swaminathan.

What is WHO's position on 'herd immunity' as a way of fighting COVID-19?

Antwort an @WWakeUpTime

It's a real mystery.
